Project Number: 21-308862.2

Report To:

Partner Engineering & Science, Inc.--Oakland
 Joe Mangine
 1017 22nd Ave. Suite 107
 Oakland, CA 94606

Date Due: 05/21/21 17:00 (5 day TAT)

Received By: Dave Berner

Date Received: 05/14/21 08:43

Logged In By: Jennifer Berger

Date Logged In: 05/14/21 10:49

Samples Received at: **5.8°C**
 Custody Seals Yes Received On Ice Yes
 Containers Intact Yes
 COC/Labels Agree Yes
 Preservation Confirmed No

Chapter One: Introduction

Overview and Applicability of the CLSP Phase 2 Amendment

The City of Lathrop adopted the Central Lathrop Specific Plan (CLSP) on November 9, 2004. The 2004 CLSP provided for the development of approximately 1,521 acres located south of the northern city limit line, west of Interstate-5, north of the Mossdale Village planning area, and east of the San Joaquin River as illustrated in Figure 1.1 and 1.2 (CLSP Plan Area).

The CLSP Plan Area consist of two primary development phases. Phase 1 of the CLSP covers approximately 797 acres in the southern portion (Phase 1 Plan Area), and Phase 2 applies to the 724-acre northern portion (Phase 2 Plan Area). Dos Reis Road serves as the dividing line between the two phases.

The City of Lathrop General Plan, in effect when the 2004 CLSP was adopted, provided for the development of a residential mixed use community in both Phases 1 and 2. The City of Lathrop recently adopted an update to the Lathrop General Plan on September 19, 2022. The 2022 Lathrop General Plan changed the prior General Plan residential, parks, schools, and commercial land use designations in the CLSP Phase 2 Plan Area to Limited Industrial, while maintaining the Open Space and Linear Park designation along the Mossdale Tract levee. The 2022 General Plan Update did not change the adopted land use designations in Phase 1 Area which allowed the development of residential neighborhoods, commercial areas, and public facilities including a high school, a community center and parks.

Development has occurred in the Phase 1 area, but no development has occurred within the Phase 2 area.

The Central Lathrop Specific Plan Phase 2 Amendment (“CLSP-2 Amendment”) includes updates and modifications only for the Phase 2 Plan Area portion of the Central Lathrop Specific Plan comprising the 724-acre area north of Dos Reis Road. **The CLSP-2 Amendment does not, in any way, alter, amend, or otherwise change the vested entitlements for the CLSP Phase 1 area, which is the 797-acre area south of Dos Reis Road. The original 2004 CLSP and the associated entitlements continue to govern the residential mixed use development in the CLSP Phase 1 Plan Area.**

The CLSP-2 Amendment revises all policies, regulations, land use concepts, and development standards with respect to Phase 2 and supersedes the 2004 CLSP for the area north of Dos Reis Road.

Table 1.1 identifies the chapters of the CLSP-2 Amendment and the corresponding chapters they supersede in the original 2004 CLSP.

The City of Lathrop is the sponsor of the CLSP-2 Amendment in order to amend the 2004 CLSP for the Phase 2 Plan Area so that the CLSP-2 Amendment is consistent with the recently adopted 2022 Lathrop General Plan. The 2004 CLSP designated residential, parks, schools, and commercial uses within the CLSP Phase 2 Plan Area. The CLSP-2 Amendment changes the residential, parks, schools, and commercial land uses within the Phase 2 Plan Area to Limited Industrial and retains the Open Space designation consistent with the 2022 Lathrop General Plan. The CLSP-2 amendment will implement the 2022 General Plan policies and establish clear direction for the development of the Plan Area. This land use change is consistent with the City’s efforts to support the Mossdale Tract’s provision of 200-year urban level of flood protection.

Table 1.1: Relationship between the 2004 CLSP and CLSP-2 Amendment

Chapter in 2004 CLSP (Superseded for the Phase 2 area)	Chapters in CLSP-2 Amendment for Phase 2 area

Chapter Seven: Community Design	Chapter Seven, Design Guidelines
Chapter Eight: Implementation	Chapter Eight: Implementation
Chapter Nine: Financing	Chapter Nine: Financing

Purpose

The purpose of the CLSP-2 Amendment is to create a comprehensive planning framework that guides the development of the 724 acres within the Phase 2 Plan Area in a manner consistent with the 2022 Lathrop General Plan. The CLSP-2 Amendment is consistent with and based upon the 2022 Lathrop General Plan long-term vision for the Central Lathrop Specific Plan area.

The CLSP-2 Amendment contains policies, action items and exhibits regarding Phase 2 land use, circulation and transportation, management of natural resources, infrastructure, design guidelines, implementation, and financing.

Planning Vision

The Stockton-Tracy-Lathrop-Manteca region has experienced record growth that is anticipated

to continue. Of the cities located in San Joaquin County, Lathrop has become one of the fastest growing cities of its size, and financially stable cities in the State of California. This status is due to its location, availability of housing and jobs, and strategic planning that has provided a vast amount of land designated to create an ideal balance of housing, retail, services, leisure, and jobs creating industries for decades of sustainable growth.

The CLSP-2 Amendment designates land uses for a variety of business opportunities to support the skilled and educated workforce of Lathrop and the local area. Creating a relationship between jobs for the community and housing is paramount. Attracting businesses is essential in reducing the need for residents to commute out of the area, generating revenue for the city, as well as decreasing carbon emissions by reducing

vehicle miles travelled (VMT) of lengthy commutes throughout the County and beyond.

The 2022 Lathrop General Plan supports environmentally sensitive and sustainable employment growth by establishing land for industrial development within the Plan Area. The CLSP-2 Amendment is consistent with the 2022 General Plan in fulfilling the goals listed in Table 1.2 below. In addition the CLSP-2 Amendment complies with the LU-5 Implementation Actions outlined in the 2022 General Plan and listed in Table 1.3 below.

Table 1.2: Goals from the 2022 Lathrop General Plan

Land Uses
LU-1: Accommodate a mix of land uses that meet the needs of residents, businesses, and visitors with places to live, work, shop, be entertained and culturally engaged.
LU-2: Promote objectives and development in special planning areas consistent with adopted specific plans, overlay districts, master plans and density bonus provisions.
LU-3: Participate in coordinated local and regional land use planning activities.
LU-4: Coordinate and integrate land use planning and transportation objectives.
LU-5: Ensure that new development is compatible with existing development. <i>Refer to Table 1.3 for LU-5 Implementation Actions</i>
LU-6: Promote the development of job-generating land uses to support existing and future businesses.
LU-7: Preserve Lathrop’s agricultural heritage by protecting and maintaining significant areas of agricultural lands around the city, and by reducing land use conflicts with agricultural operations.
Circulation
CIR-1: Develop and maintain a roadway system that accommodates all users.
CIR-2: Create a system of pedestrian, bicycle, and transit facilities that enables non-automotive accessibility and increases the health and livability of the community.
CIR-3: Support the movement of goods through trucking, rail, and other forms of freight service while maintaining quality of life for city residents.
CIR-4: Plan for the future of transportation to ensure accessibility for all, reduce the environmental impacts of transportation, and improve the quality of life.
Economic Development
ED-1: Retain and expand existing businesses.
ED-2: Broaden the local economic base.
ED-3: Provide diverse workforce housing options.
ED-4: Enhance community quality of life.

Public Facilities and Services
PFS-1: Provide effective, adequate, cost-efficient, and high-quality community services and facilities for residents, businesses, institutions, and visitors in Lathrop.
PFS-2: Provide existing and projected development with reliable, adequate access to clean, safe and potable water.
PFS-3: Provide the community with a wastewater system that is efficient, safe, cost-effective, and able to meet the needs of existing and future development.
PFS-4: Provide the community with an efficient, attractive, and environmentally sound stormwater system to accommodate runoff from existing and new development and prevent property damage due to flooding.
PFS-5: Ensure the community has access to adequate energy services, provided through economically and environmentally sustainable means.
PFS-6: Ensure state-of-the-art technology and telecommunications services for households, businesses, and the community is available throughout the city.
PFS-7: Provide the community with high-quality public safety services, facilities, and technology that protects against illicit activities and crime.
PFS-8: Coordinate with school districts to provide the community with educational facilities and opportunities that support the continued lifelong learning of all residents.
PFS-9: Provide the community with environmentally responsible waste disposal and recycling services that minimize the generation of disposal of waste.
PFS-10: Support the use of recycled water to meet water demands.
Public Safety
PS-1: Prepare the community for natural hazards related to landslides, geologic instability, and seismic activity to minimize loss of life, injury and property damage, and disruption of vital services.
PS-2: Protect the safety of life and property and prepare for urban and wildfire emergencies.
PS-3: Protect the community from potential flood hazards to minimize loss of life, injury, and property damage, and disruption of vital services.
PS-4: Protect the community from the potential for hazardous waste and materials contamination.
PS-5: Prepare and equip the community to handle emergency situations, in order to minimize loss of life, injury, property damage, and disruption of vital services.

PS-6: Prepare the community to adapt to climate change, including extreme weather events, in order to minimize risks to life, property, the economy, and the environment.
Recreation and Resources
RR-1: Provide the community with high-quality parks and recreational amenities.
RR-2: Protect and manage natural open space areas to provide scenic beauty and community enjoyment.
RR-3: Preserve and protect prehistoric, historic, archaeological, and paleontological resources, to bolster community identity and protect sensitive resources.
RR-4: Protect and maintain animal and plant species, city trees, waterways, and other supporting biological habitats within Lathrop.
RR-5: Balance the extraction of mineral resources with future development and conservation opportunities.
RR-6: Provide the community with optimal air quality.
RR-7: Protect the health of the bay delta.
RR-8: Promote water conservation throughout the region.
Noise
N-1: Protect residents from the harmful effects of exposure to excessive noise.
N-2: Protect the economic base of the city by preventing the encroachment of incompatible land uses near noise-producing roadways, industries, the railroad, commercial and mixed-use districts, and other sources.
Environmental Justice
EJ-1: Promote land use and development patterns that reduce greenhouse gas emissions, enhance air quality, and reduce climate change impacts in environmental justice communities.
EJ-2: Take measures to reduce pollution exposure and improve air quality in environmental justice communities.
EJ-3: Ensure that public facilities and services are equitably distributed throughout the city of Lathrop and are available to residents of environmental justice communities.
EJ-4: Expand access to healthy food and nutritional choices for all residents in the community.

EJ-5: Promote and ensure healthy living conditions for all residents, particularly those in environmental justice communities.
EJ-6: Promote land use and development patterns that encourage physical activity and improve multimodal access and connectivity to employment, shopping, services, schools, parks and other destinations.
EJ-7: Improve the physical fitness of the City’s residents, particularly those who live in environmental justice communities.
EJ-8: Create accessible and culturally appropriate opportunities for all people regardless of race, color, national origin, or income to engage in the decision-making process.
EJ-9: Prioritize improvements and programs that address the needs of environmental justice communities.

Table 1.3: LU-5 Land Use Compatibility Implementation Actions from the 2022 Lathrop General Plan

LU-5.a: Through the development review process, screen development proposals for land use and transportation network compatibility with existing surrounding or abutting development or neighborhoods.
LU-5.b: Through the development review process, analyze land use compatibility and require adequate buffers and/or architectural enhancements to protect sensitive receptors from intrusion of development activities that may cause unwanted nuisances and health risks.
LU-5.c: When industrial projects, including warehouse projects, fulfillment centers, and other projects that may generate high volumes of truck trips and/or air quality emissions are proposed within 1,000 feet of existing or planned residential uses or other sensitive receptors, the City shall require the preparation of a Health Risk Assessment (HRA) that meets the standards established by the Office of Environmental Health Hazard Assessment (OEHHA), and the San Joaquin Valley Air Pollution Control District (SJVAPCD). Projects shall not be approved until it can be demonstrated that the project would not result in an exceedance of the established thresholds of significance for public health risks at nearby sensitive receptors.
LU-5.d: When industrial projects, including warehouse projects, fulfillment centers, and other projects that may generate high volumes of truck trips and/or air quality emissions are proposed within 1,000 feet of existing or planned residential uses or other sensitive receptors, the City shall require the implementation of best management practices (BMPs) to reduce pollution exposure to sensitive receptors, particularly diesel particulate matter (DPM). The appropriate BMPs shall be established on a case-by-case basis, and should consider the following tools, methods, and approaches:

- Creating physical, structural, and/or vegetative buffers that adequately prevent or substantially reduce pollutant dispersal between warehouses and any areas where sensitive receptors are likely to be present, such as homes, schools, daycare centers, hospitals, community centers, and parks.
- Providing adequate areas for on-site parking, on-site queuing, and truck check-in that prevent trucks and other vehicles from parking or idling on public streets.
- Placing facility entry and exit points from the public street away from sensitive receptors, e.g., placing these points on the north side of the facility if sensitive receptors are adjacent to the south side of the facility. Exceptions can be made for emergency vehicle access (EVA) points.
- Locating warehouse dock doors and other onsite areas with significant truck traffic and noise away from sensitive receptors.
- Screening dock doors and onsite areas with significant truck traffic and noise with physical, structural, and/or vegetative barriers that adequately prevent or substantially reduce pollutant dispersal from the facility towards sensitive receptors.
- Posting signs clearly showing the designated entry and exit points from the public street for trucks and service vehicles.
- Posting signs indicating that all parking and maintenance of trucks must be conducted within designated on-site areas and not within the surrounding community or public streets.

LU-5.e: Update the Lathrop Municipal Code to include Good Neighbor Guidelines for Warehouse Distribution Facilities. The new Good Neighbor Guidelines should include:

- a. A definition of the type and size of facility that is subject to the Guidelines;
- b. Standards to minimize exposure to diesel emissions to sensitive receptors that are situated in close proximity to the proposed facility;
- c. Standards and practices that eliminate diesel trucks from unnecessarily traversing through residential neighborhoods;
- d. Standards and practices that eliminate trucks from using residential areas and repairing vehicles on the streets;
- e. Strategies to reduce and/or eliminate diesel idling within the facility’s site;

LU-5.f: Update the Central Lathrop Specific Plan (CLSP) to accomplish the following objectives:

- a. Bring the Specific Plan’s land use map into consistency with the General Plan Land Use Map (Figure LU-1)
- b. Establish a circulation network that keeps future truck trips as far from existing and planned sensitive receptors as feasible; this includes, but is not limited to, the following requirements, which shall be incorporated into the Specific Plan:

- i. Trucks shall be prohibited on Dos Reis Road west and east of Golden Valley Parkway, on Golden Valley Parkway south of Dos Reis Road to Lathrop Road, and on Lathrop Road east of Golden Valley Parkway to Interstate 5 southbound off-ramp.
 - ii. Future truck dependent development projects shall be prohibited from providing driveway access points off of Dos Reis Road, west of Golden Valley Parkway, other than emergency vehicle access (EVA).
 - iii. Truck traffic within the Limited Industrial Area of the Central Lathrop Specific Plan shall be limited to De Lima Road, and any future roadways north of Dos Reis Road, to connect to Manthey Road, Roth Road, and Interstate 5.
- c. Establish site design standards for new industrial projects;
 - d. Identify financing and cost-recovery methods to fund roadway and infrastructure improvements.
 - e. Circulation design standards that promote safe transportation routes that limit impacts to developed areas to the south, and connectivity enhancements to provide better connectivity to I-5.
 - f. Infrastructure improvements to improve roadway operations
 - g. Opportunities to provide employee-serving amenities onsite, such as parks and plazas, outdoor seating areas, fitness facilities, and daycare centers as a means to reduce vehicle trips, while supporting air quality, public health, and sustainability goals.
 - h. Include provisions that all development projects proposed north of Dos Reis Road and south of De Lima Road be required to obtain a Conditional Use Permit (CUP), which shall be subject to discretionary review by the City Council.

LU-5.g: During the interim period following adoption of this General Plan, and the adoption of the updates to the Central Lathrop Specific Plan, identified in Action LU-5f, the City shall enforce the following requirements for all Limited Industrial development projects, including warehouse, distribution, and logistics projects, within the Central Lathrop Specific Plan Area:

- a. Trucks shall be prohibited on Dos Reis Road west and east of Golden Valley Parkway, on Golden Valley Parkway south of Dos Reis Road to Lathrop Road, and on Lathrop Road east of Golden Valley Parkway to Interstate 5 southbound off-ramp.
- b. Future truck dependent development projects shall be prohibited from providing driveway access points off of Dos Reis Road, west of Golden Valley Parkway, other than emergency vehicle access (EVA).
- c. Truck traffic within the Limited Industrial Area of the Central Lathrop Specific Plan shall be limited to De Lima Road, and any future roadways north of Dos Reis Road, to connect to Manthey Road, Roth Road, and Interstate 5.

Figure 1.1- Regional Map

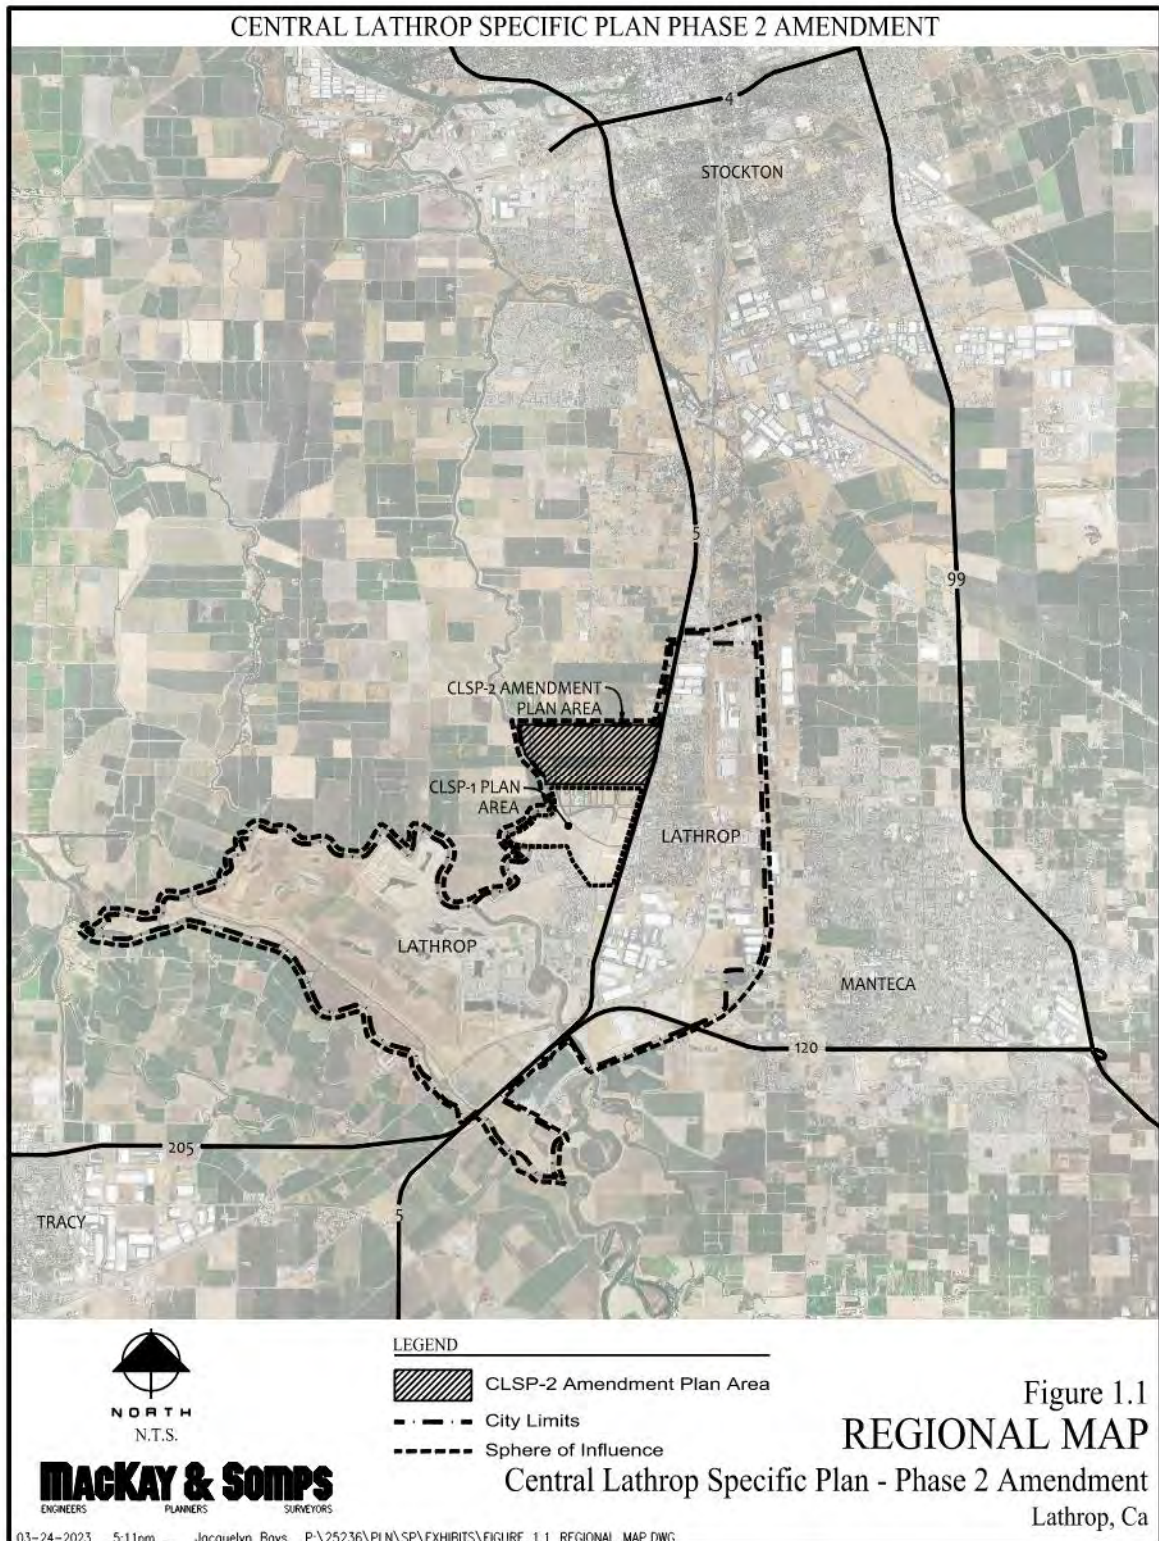

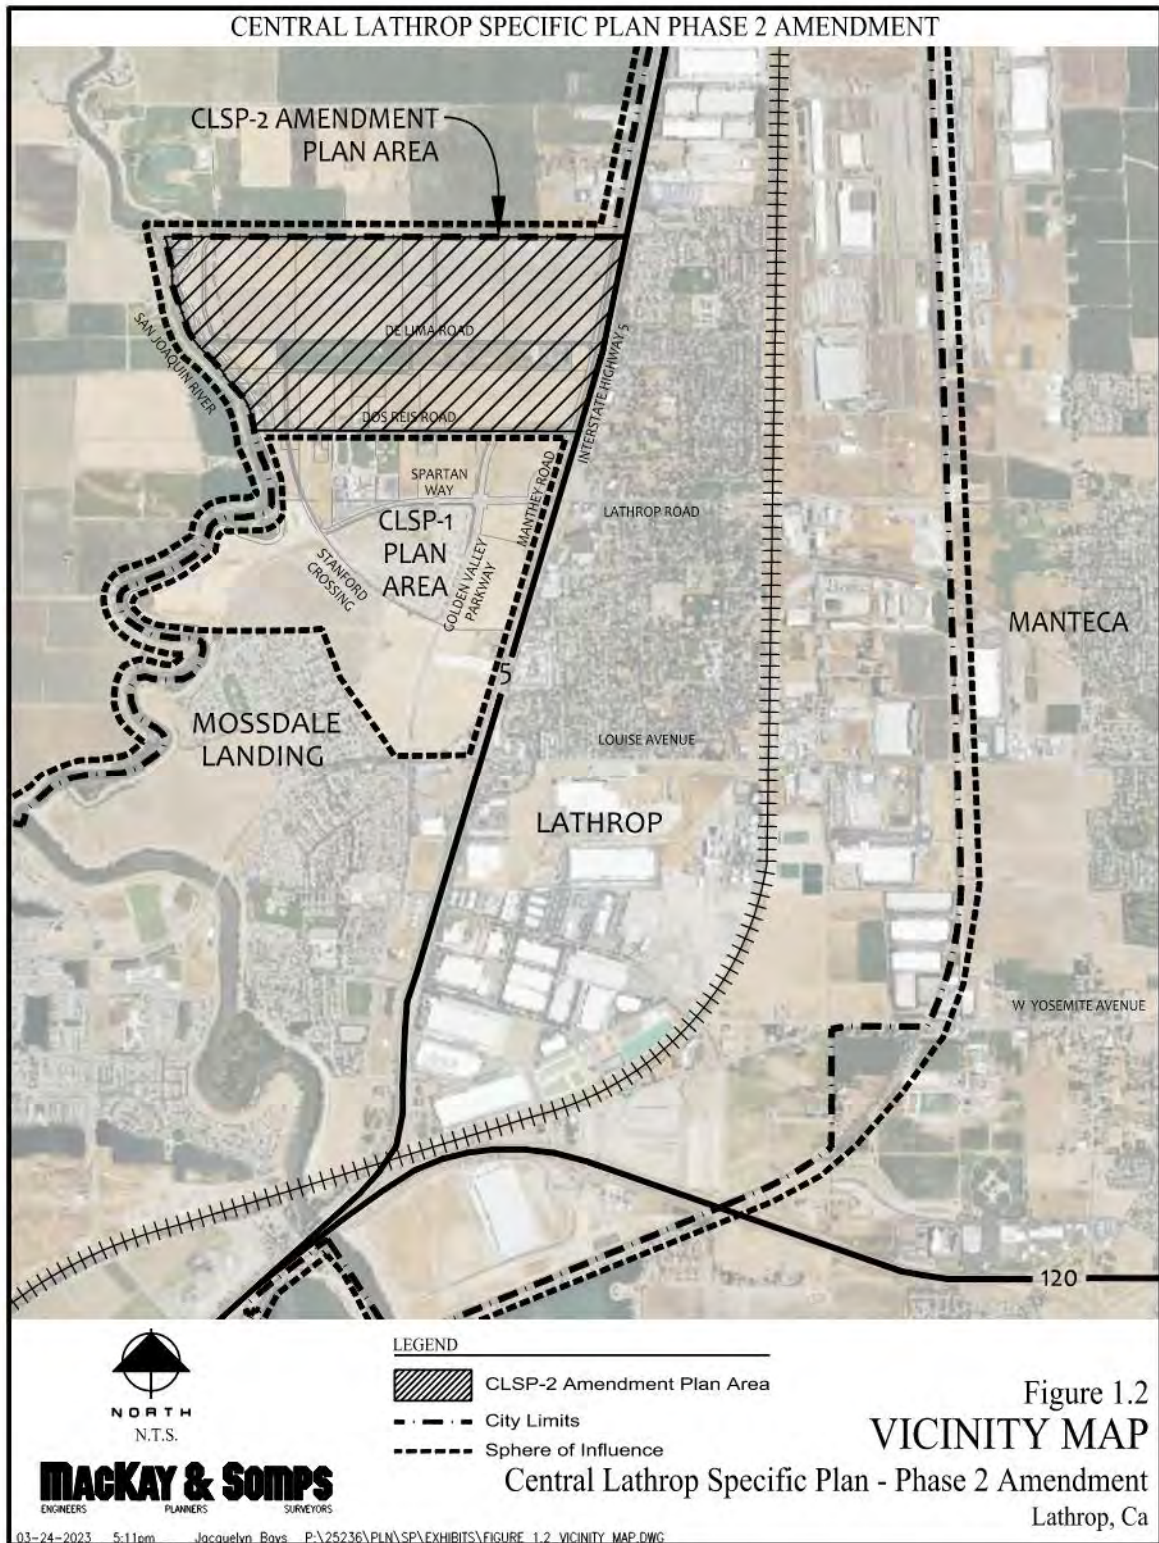

Figure 1.2- Vicinity Map

Goals of the Specific Plan

The CLSP is intended to provide for the orderly and systematic development of an integrated full-service community in a manner consistent with goals and policies of the City and compatible with site characteristics. The primary goals of the CLSP-2 Amendment are designed to achieve the following:

- Establish a comprehensive land use plan that will guide development of the approximately 724-acre CLSP-2 Amendment Plan Area.

Update the City’s long-term vision for the CLSP-2 Amendment Plan Area in accordance with the 2022 Lathrop General Plan, by incorporating refinements designed to reflect evolving innovation in land use planning concepts.

Establish a regional industrial development area adjacent to the I-5 freeway that makes use of the visibility and prime freeway access provided by the Roth Road Interchange.

Maximize passive recreational opportunities through the creation of a comprehensive linear park and open space system located adjacent to and providing access to the San Joaquin River.

Generate positive fiscal benefits for the City resulting from the regional industrial development.

Increase employment and shopping opportunities for City residents.

Provide job-generating land uses in close proximity to residential uses in order to minimize home-to-work vehicular trip lengths, automobile usage and related air quality impacts.

Provide an integrated, efficient, and safe circulation system for pedestrians, bicyclists, transit and vehicles.

Provide roadway improvements and land use planning that will tie together with existing development.

Establish a logical phasing plan that assures that each phase of development will include all necessary public improvements required to meet City standards.

Add value to the existing and future City of Lathrop community and contribute to the establishment of a strong local economic base through (a) job creation and (b) the economic stimulus that comes from the multi-million-dollar investment required to develop the Central Lathrop Specific Plan and the disposable income of the people who live and work in the Plan Area.

Implement the development program envisioned for the Central Lathrop Specific Plan on property that the Lathrop 2022 General Plan designates for Limited Industrial uses.

To the extent feasible, provide a self-mitigating project, where mitigation measures are incorporated into the CLSP-2 Amendment and future project designs, so as to minimize environmental impacts.

Provide a logical and orderly extension of the City of Lathrop that is compatible with and complements existing and planned land uses within other portions of the City.

Satisfy the City policies, regulations and expectations as defined in the Lathrop General Plan and Municipal Code.

Provide services and infrastructure that meet or exceed City standards and that do not diminish services to existing residents of the City.

Enrich the relationship between the City and the San Joaquin River by incorporating the river’s edge as a critical component of the

Central Lathrop Specific Plan parks and open space program.

These Central Lathrop Specific Plan goals are consistent with the goals of the Lathrop General Plan.

Context

Location

Lathrop is located within the southwest quadrant of San Joaquin County. The Central Lathrop Specific Plan area is located within the northwest area of the City. See Figure 1.1: Regional Map.

The CLSP-2 Amendment Plan Area encompasses approximately 724 acres located south of the city limit line, north of Dos Reis Rd, west of Interstate 5, and east of the San Joaquin River. See Figure 1.2 for the Vicinity Map.

Property Ownership

The CLSP-2 Amendment encompasses 724 acres divided among 25 existing parcels. Figure 1.3 lists the property owners.

Existing Site Conditions and Uses

The CLSP-2 Amendment Plan Area consists primarily of undeveloped land and agriculture uses, along with the existing Dos Reis Regional Park and boat launch, and various existing rural residences. The existing Dos Reis Regional Park is located adjacent to the San Joaquin River along the west side of the CLSP-2 Amendment Plan Area. The undeveloped land and existing agriculture uses comprise the majority of the remaining land acreage extending from the San Joaquin River, east to Manthey Road and Interstate-5. See Figure 1.4 for Existing Conditions Map.

Dos Reis Park, a county/state facility located along the San Joaquin River at the end of Dos Reis Road, while a part of the CLSP-2 Amendment Plan Area, is intended to remain under county/state ownership and maintenance.

Few trees, aside from the orchard trees, exist beyond those along the riverbed and on rural residential sites. A few rural roads (Manthey Road, De Lima Road, and Dos Reis Road) cross or border the Plan Area to provide access to the river, farmlands, and rural residences. No known major utility easements or facilities are present, except for water lines in Dos Reis Road, De Lima Road, and a portion of Manthey Roads; and a storm drain force main in Dos Reis Road that serves existing develop east of Interstate-5.

Plant habitats are isolated within narrow corridors located along portions of the San Joaquin River. All lands have been modified by human activities. The area is generally flat, with a slight fall from east to west towards the San Joaquin River. The area is protected from flood hazards by the levee paralleling the river. Groundwater is relatively shallow. No parcels are under Williamson Act contracts.

Adjacent Uses

A variety of existing land uses surrounds the CLSP-2 Amendment Plan Area. To the south of Dos Reis Road from west to east is a planned community park and open space trail along the levee; the existing Lathrop High School sports fields and auxiliary parking area, undeveloped land designated as Residential Mixed Use, and undeveloped land designated as Office Commercial. To the west is the San Joaquin River and to the north is San Joaquin County land with existing agriculture and industrial uses. Interstate 5 is east of the Plan Area.

Jurisdictional Context

Since the City approved the 2004 CLSP, the CLSP Plan Area has been annexed into the City of Lathrop. The area or portions thereof, are within the jurisdiction of the Manteca Unified School District, Reclamation District 17 (RD-17), and the Lathrop Manteca Fire District (LMFD). No changes to the boundaries of these districts are proposed.

Figure 1.3- Existing Ownership Map

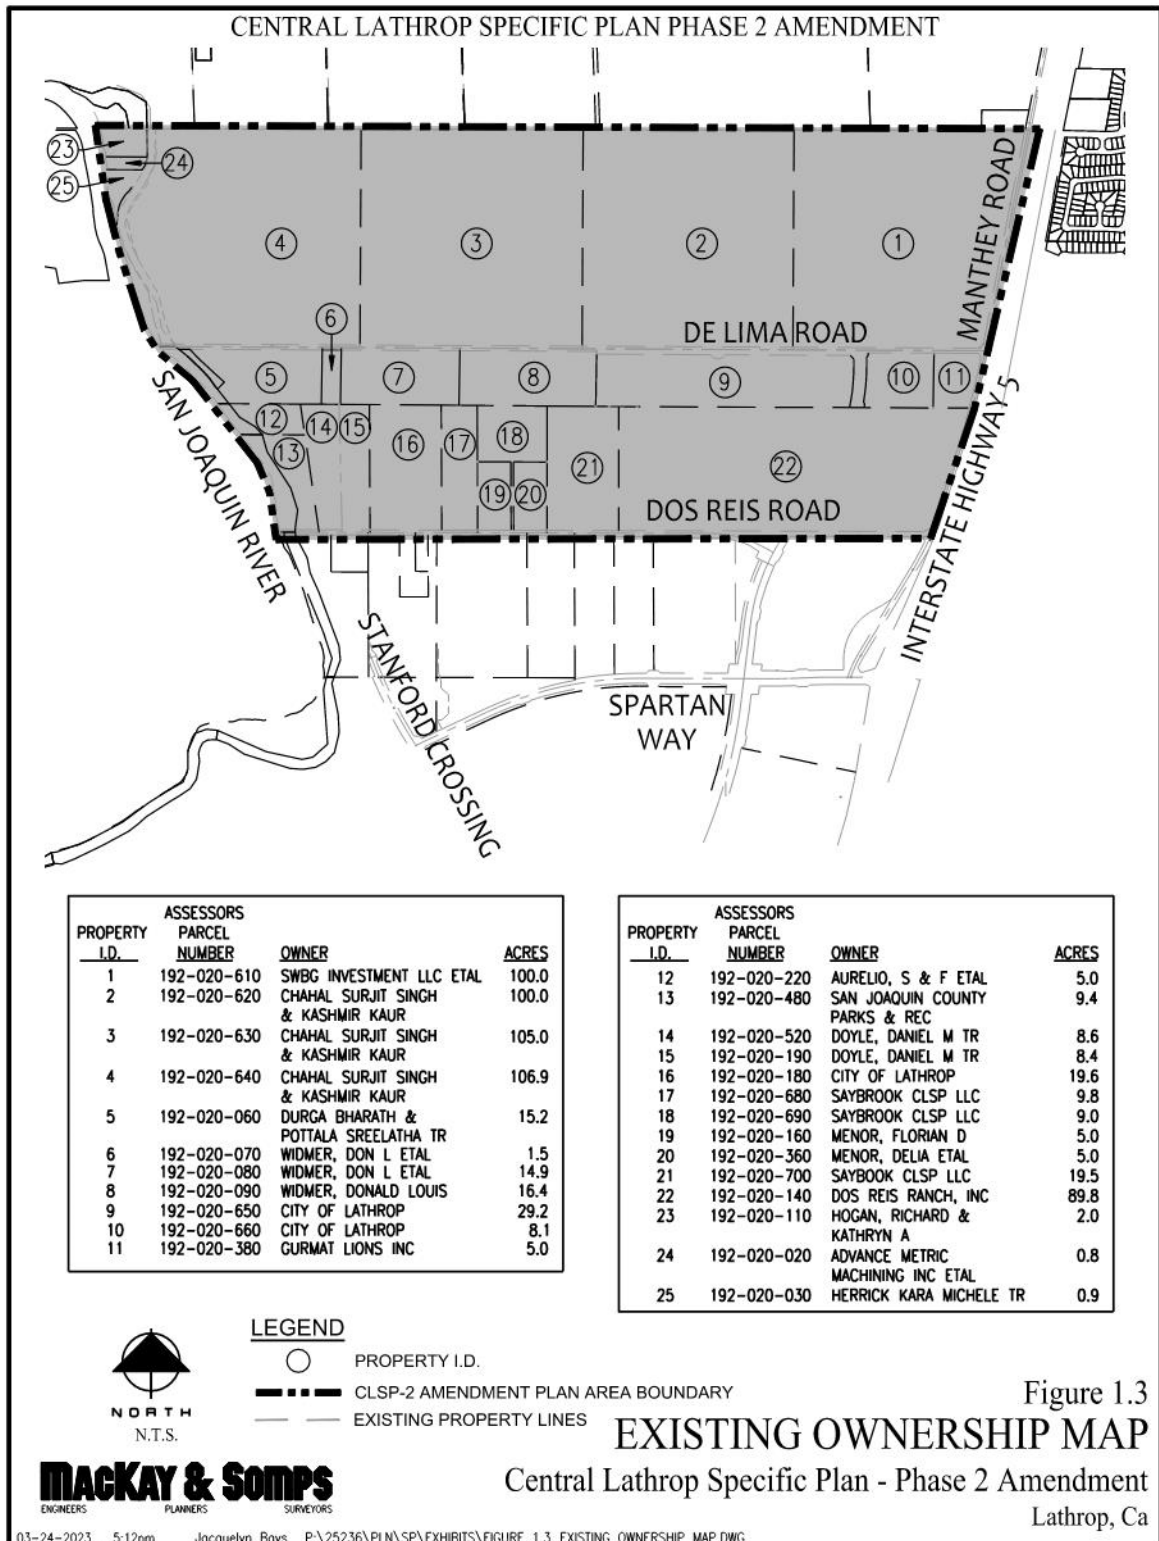

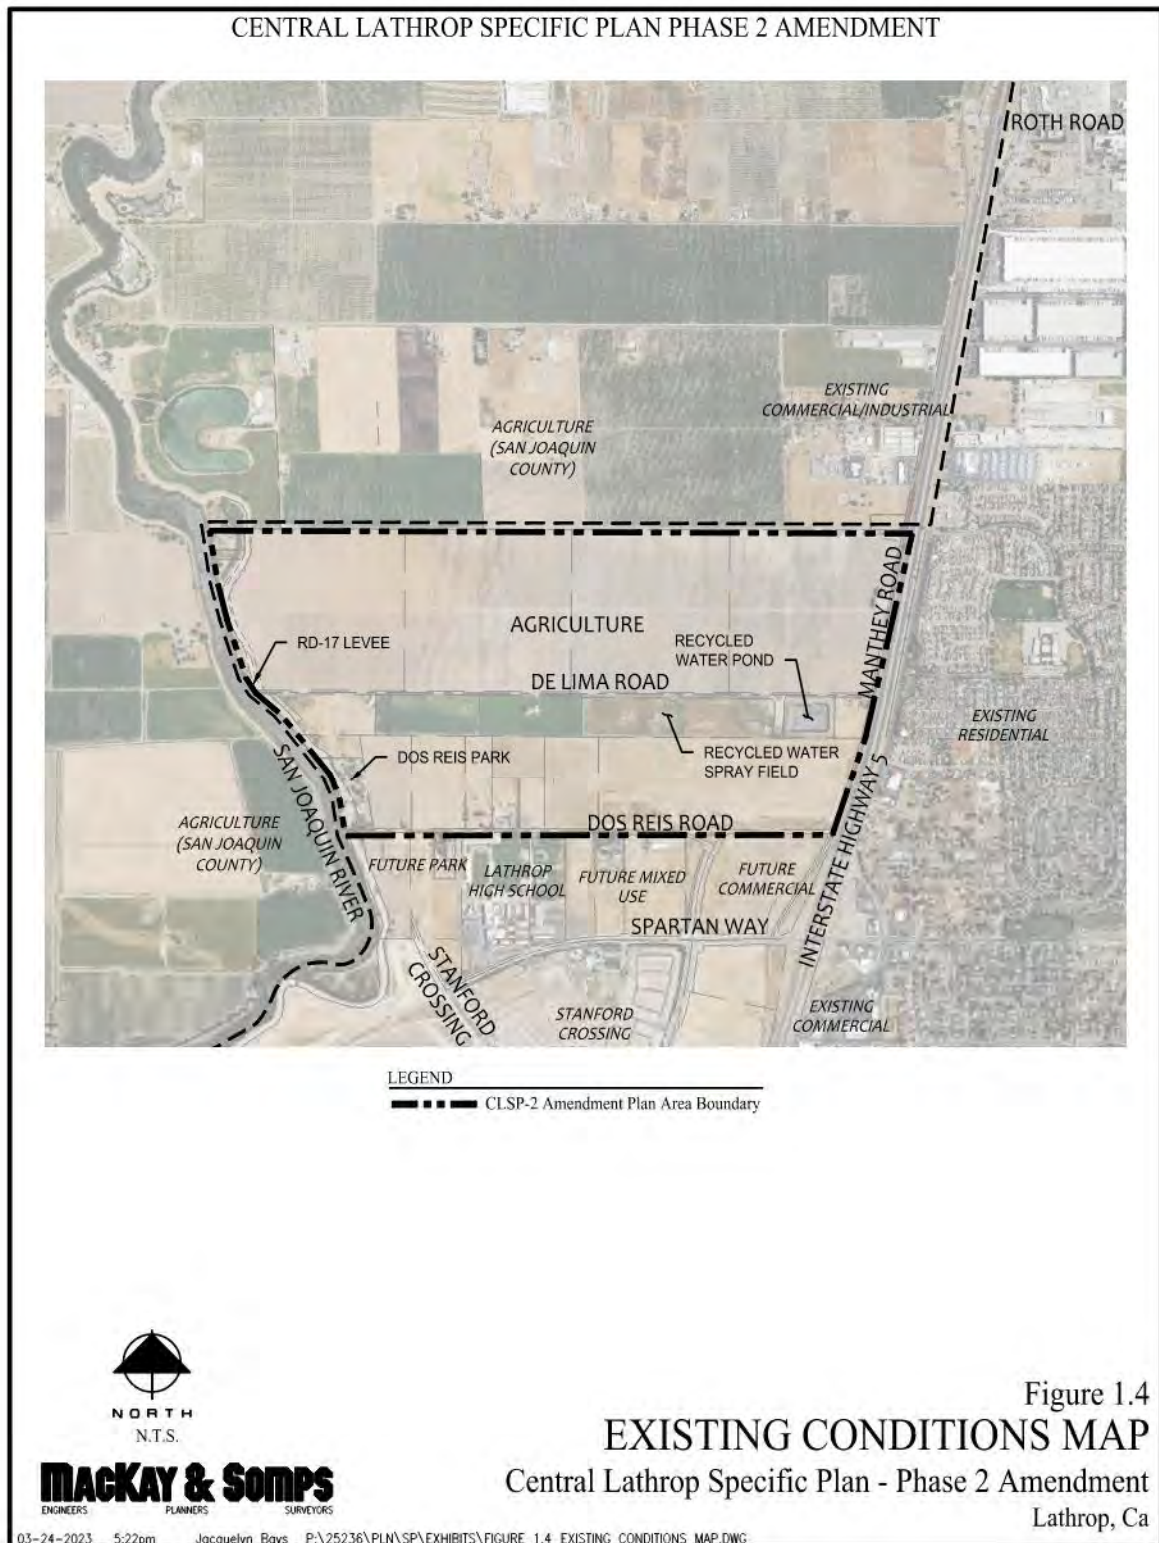

Figure 1.4- Existing Conditions Map

Legal Authority

The City of Lathrop, as a general law city, will adopt this Specific Plan Amendment, and other project related documents by resolution in accordance with the provisions of Article 8, Sections 65450 through 65457 of the California Government Code. These provisions require that a specific plan be consistent with the City’s adopted general plan. All other subsequent entitlements and approvals must also be consistent with the Lathrop General Plan.

State law also requires that all subsequent subdivisions and developments (including public works projects) within the Phase 2 Plan Area, as well as all zoning regulations applicable to the Phase 2 Plan Area, must be consistent with this CLSP-2 Amendment.

Relationship to the Lathrop General Plan

The General Plan establishes the goals, policies, land uses, and standards for development within the City. The following related plans, incorporated by reference, provide additional detailed direction for future development of the CLSP-2 Amendment Plan Area.

Wastewater, Water and Recycled Water Master Plans

Wastewater (collection and treatment), water (supply and distribution), and recycled water (wastewater disposal) master plans were adopted by the City. These plans identify improvements needed to serve current and future land uses at build out and provide a basis for the orderly expansion of potable, waste, and recycled water facilities. In conjunction with other plans, these documents establish phasing and costs.

Bicycle Transportation Master Plan

The City of Lathrop’s Bicycle Transportation Master Plan establishes goals, policies, routes and standards for bicycle transportation and facilities within the City.

Relationship to Other City Policies, Programs, and Documents

The supporting documents described below establish the foundation and/or provide direction for the implementation of this CLSP-2 Amendment. These documents will be utilized in conjunction with the CLSP-2 Amendment to ensure the implementation of the General Plan’s goals and policies.

Capital Facilities Fee Program

The City’s Capital Facilities Fee program identifies the capital improvements needed for development. This document establishes a variety of financing vehicles and fees to pay for public infrastructure and community facilities to serve the new development areas.

Municipal Code

Special zoning districts have been created for the CLSP Plan Area. These special zoning districts end in “CL” to designate these land use categories as unique to the Central Lathrop Specific Plan area. The amended zoning categories for the Phase 2 Plan Area are described in detail later in this CLSP-2 Amendment and are incorporated into the Lathrop Municipal Code.

Development Agreement

Development Agreements to be potentially entered into between the City and landowners within the Plan Area can vest, or “lock in” development rights. Development agreements can establish the responsibilities of landowners with respect to the construction and financing of public infrastructure, the dedication of land, and other development-related obligations.

Environmental Impact Report

Refer to the Implementation chapter for details regarding the relationship between the CLSP-2 Amendment and the EIRs prepared with the original 2004 CLSP and the 2022 General Plan.

Organization of the Specific Plan

The CLSP-2 Amendment is organized as follows:

Chapter One: Introduction - discusses the purpose, planning context, primary goals, and scope of the Specific Plan Amendment.

Chapter Two: Land Use - describes the way in which the land uses that comprise the CLSP-2 Amendment Plan Area are organized and includes a discussion of the general character of such uses, their location within the Plan Area, the intensities of use, and the goals associated with each of the designated land uses.

Chapter Three: Circulation and Transportation - explains the CLSP-2 Amendment roadway network in the context of the local, city, and regional transportation and circulation patterns, and the system of pedestrian and bicycle paths.

Chapter Four: Natural Resources Management - describes the ways in which the environmental features of the plan area are integrated into the CLSP-2 Amendment and the program to protect these features, as well as to allow them to be enjoyed by residents and non-residents alike.

Chapter Five: Community Services and Facilities - describes the needs for community services and facilities that will result from the development of the CLSP-2 Amendment and the way in which these needs will be addressed.

Chapter Six: Utilities and Drainage Infrastructure - discusses the various utility and drainage improvements required to serve the Phase 2 Plan Area.

Chapter Seven: Design Guidelines - provides the site planning, including landscape and open space, and architectural standards for each land use, further ensuring a high-quality and unique development.

Chapter Eight: Implementation - describes the way in which the CLSP-2 Amendment will be

executed, including development phasing strategies and the permitting process for individual development proposals.

Chapter Nine: Financing - describes anticipated project construction and maintenance needs and financing mechanisms, and the key financing options that are available to fund these costs.

Chapter Two: Land Use

Introduction

The Land Use and Development Plan is the primary implementing component of the CLSP-2 Amendment. This chapter summarizes the different land uses proposed, refines land use types that are identified in the 2022 General Plan and lists the development standards. This chapter, including the Land Use Plan, describes the land use designations and zoning. The 2022 General Plan Land Use Map and the CLSP-2 Amendment Land Use Plan govern the land uses in the CLSP Phase 2 Plan Area.

Existing and Interim Land Uses

Existing agricultural uses, recycled water storage ponds, agricultural irrigated with recycled water and several rural residences are located within the CLSP-2 Amendment Plan Area. These existing uses will remain until the property is developed and therefore referred to in this document as Interim Uses.

The existing uses within the CLSP Phase 1 Plan Area include various residential neighborhoods commonly referred to as Stanford Crossing, a high school, a community center, teen center/library, several public neighborhood parks, and some commercial development. Some agricultural uses and rural residences remain will remain until developed in the future in accordance with the Lathrop General Plan.

The CLSP-2 Amendment development standards for the Phase 2 Plan Area are consistent with the development standards in the City of Lathrop's Zoning Ordinance. Separate Design Guidelines apply as set forth in Chapter Seven.

The Land Use Plan was influenced by a variety of factors including physical site constraints and adjacent land uses as discussed in Chapter One.

This CLSP-2 Amendment may evolve over time, taking into consideration market change and community desires and needs. As property owners and builders develop their properties, they will be required to follow the Site Plan Review process and, if applicable, obtain a Conditional Use Permit. The development plans for each property will be designed based on the policies and standards contained in this Specific Plan Amendment.

Overall, the CLSP-2 Amendment designates 618.2 acres of Limited Industrial uses, 11.2 acres of Parks, and 29.3 acres of Open Space in Phase 2.

Land Use Plan

The CLSP-2 Amendment is designed to create a range of employment uses along with some recreational uses along the San Joaquin River levee system for City residents and employees. The CLSP-2 Amendment Plan Area encompasses approximately 724 acres. Refer to Figure 2.1. The overall Phase 2 Plan Area land uses, acreages, and intensities of use are summarized in Table 2.1; this summary represents the build-out of the CLSP-2 Amendment Plan Area.

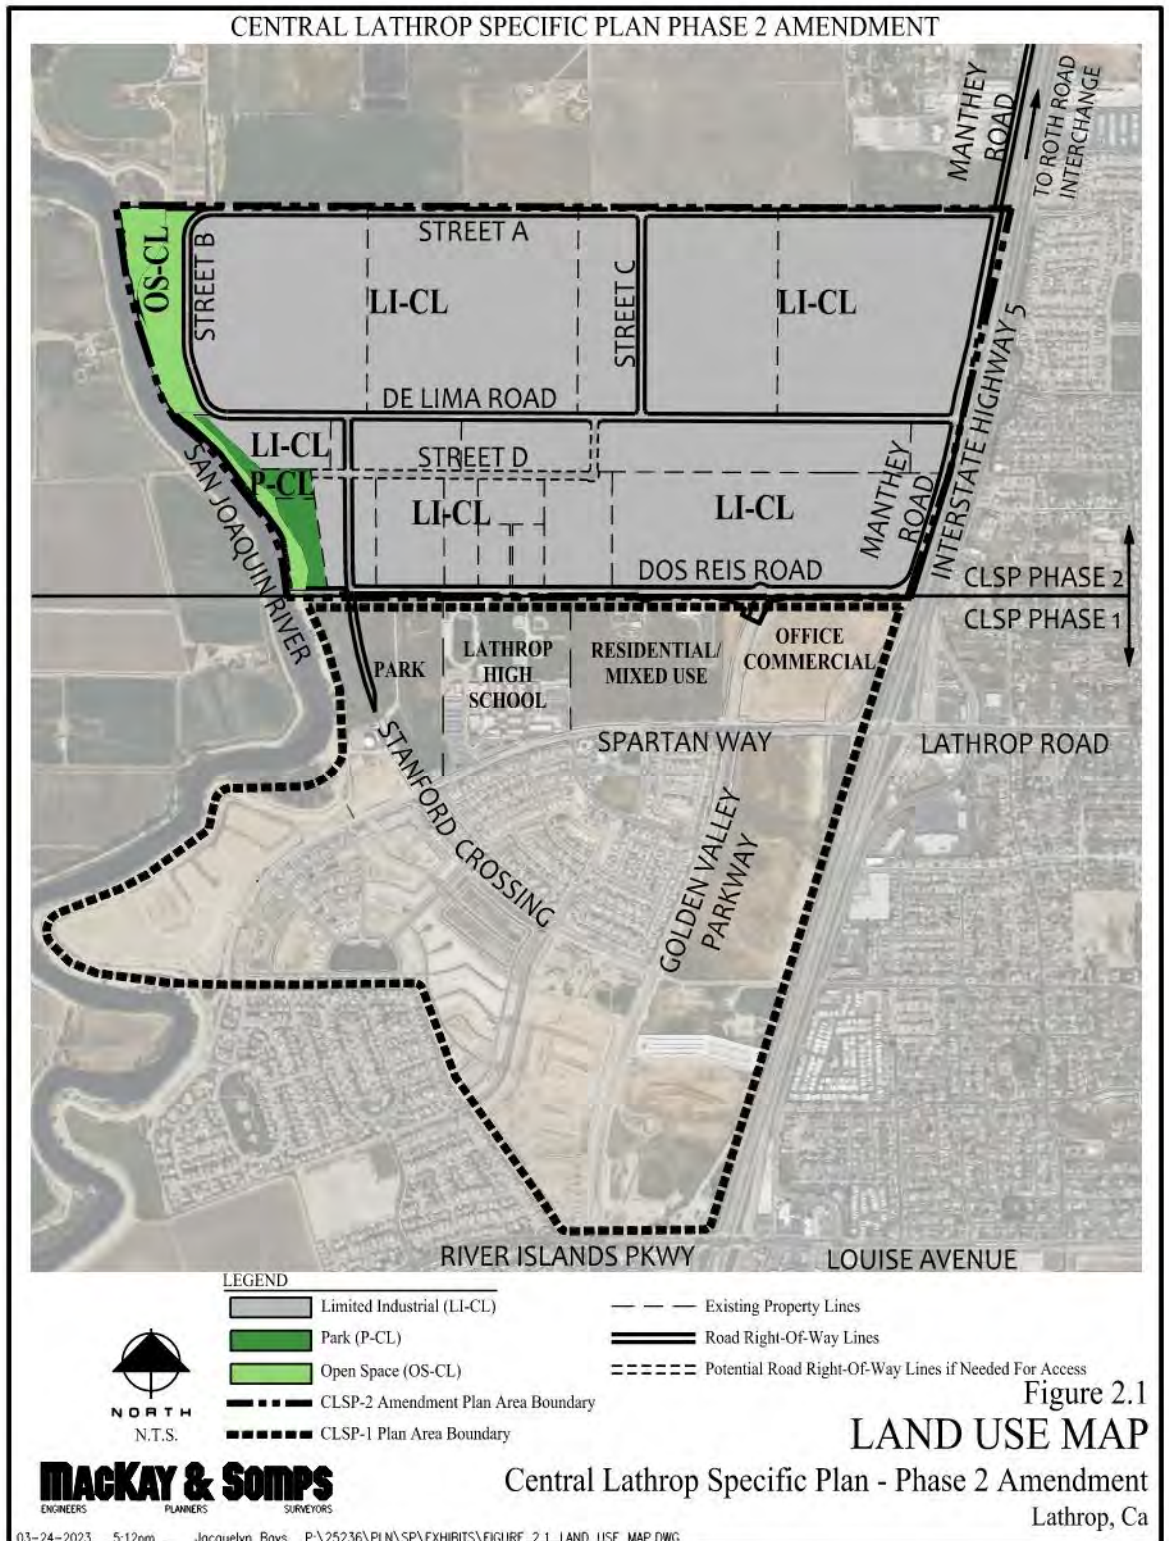

The Land Use Map (Figure 2.1) illustrates the land uses within the CLSP-2 Amendment Plan Area. Table 2.1 provides a summary of these land uses. The acreage and allowable square footages for each land use category may vary slightly from these acreages shown depending on more accurate survey data and the final alignment

of roadways and required open space; however, the total acreages and building square footage establish an approximate carrying capacity for the Plan Area.

Landscape Buffer

A landscape buffer shall be provided along the north side of Dos Reis Road as illustrated in Figure 2.2 with two (2) different design themes. At locations where existing or proposed Land Use on the south side of Dos Reis Road includes sensitive receptors, the landscape buffer shall include a 30-foot-wide landscape corridor within the public right-of-way including 22' of landscaping and a 8' paved sidewalk as well as an additional buffer on the adjacent private development parcels. At other locations on Dos Reis Road where Commercial or Industrial use is proposed to the south, the landscape buffer shall include a 26-foot-wide landscape corridor within the public right-of-way including 18 feet of landscaping and an 8 foot paved sidewalk as well as an additional buffer on the adjacent private development parcels. The additional buffer on the adjacent private development parcels in both scenarios shall be determined during the Site Plan Review process for each specific development project.

Central Lathrop Specific Plan - Phase 2 Amendment

Lathrop, Ca

Table 2.1: CLSP-2 Amendment Land Use Summary

Designation	Land Use	Area (acres)	Maximum Building Square Footage at Max FAR of 1.0 (SF)	Potential Building Square Footage at Target FAR of 0.75 (SF)
LI-CL	Limited Industrial [1]	618.2	26,928,792	20,196,594
OS-CL	Open Space	29.3	1,276,308	957,231
P-CL	Park	11.2	487,872	365,904
	Major Road Right-of-Way	65.3	2,844,468	2,133,351
	Total	724.0	31,537,440	23,653,080

[1] Allowable FAR. of 1.0 per the 2022 General Plan

[2] Target FAR of 0.75

The above table represents the proposed development acreages by land use. Calculated acres are based upon the overlay of the land uses onto a property boundary map compiled from record dimensions only (not a field survey). Actual acres may vary slightly, but will be confirmed with each development application.

Land Use Designations

The following sections define and discuss the land use designations that occur within the Plan Area. The Central Lathrop combining district (CL) is applied to all properties located within the CLSP-2 Amendment Plan Area. The designation of CL after any zoning district indicates that the zoning district so combined is modified by the regulations included in the CLSP-2 Amendment and those districts included in Chapter 17.62 of the Lathrop Municipal Code.

Permitted uses, conditionally permitted uses, and development criteria can be found in the same chapter of the Code. Of particular note is that the 2022 General Plan requires a Conditional Use Permit (CUP) for all development between Dos Reis Road and De Lima Road.

The Plan Area consists of three land use designations including Limited Industrial, Park, and Open Space. A well thought out circulation pattern allows for vehicular, bicycle and pedestrian connections between the uses.

Limited Industrial

The Limited Industrial (LI) use applies to most of the Plan Area. The Limited Industrial use spans from the northern project boundary along Lathrop’s city limits, southern boundary along Dos Reis Road, and eastern boundary along Interstate Highway 5 as shown in Figure 2.1. It is anticipated that uses such as warehousing and manufacturing that do not require a high degree of visibility and are truck dependent, will be located in areas of the Plan Area that minimize the potential for air quality and noise impacts to sensitive receptors outside the Plan Area. The CLSP-2 Amendment Plan Area is envisioned to accommodate a wide range of jobs generating uses, including business parks; clean light industrial; research and development (R&D); science, technology, engineering, and math (STEM); tech/biotech manufacturing; high-tech services that incorporate some combination of assembly; warehousing, and/or sales; hospitals, labs and other health care-related uses, and distribution centers. Refer to the City of Lathrop’s Zoning Ordinance for the full range of

permitted and conditionally permitted uses under this land use category. A maximum allowable Floor Area Ratio (FAR) of 1.0 is permitted consistent with the 2022 General Plan.

Open Space

The CLSP-2 Amendment designates Open Space (OS) uses along the San Joaquin River and this designation spans the length of the Plan Area. This area is designed to provide an open space corridor consistent with the Lathrop General Plan. The open space corridor along the San Joaquin River is intended as a local community wide facility with the possibility of regional linkage. This Open Space Corridor would also connect the CLSP-2 Amendment Plan Area with developing and existing segments of this open space corridor to the south within CLSP Phase 1 and the Mossdale Village developments. Though not required or mandated, this CLSP-2 Amendment accommodates the construction and use of outdoor recreation facilities such as recreation fields, fitness equipment and courses, or other such uses intended for the physical recreation and well-being of the community and/or the employee users. Refer to the CLSP-2 Amendment Zoning Ordinance for the full range of permitted uses in this land use category.

Park

The CLSP-2 Amendment retains the Dos Reis County Park designation, a County park within City limits. An additional Park area is proposed to connect the park to the future open space corridor described above.

Because the build-out of the CLSP-2 Amendment Plan Area is anticipated to occur over an extended period of years, these Interim Uses may remain present for many years.

Interim Agricultural uses are subject to Agricultural Development Standards and Use Regulations set forth in the Lathrop Zoning Ordinance. Refer to Chapter 17.116 of the Lathrop Zoning Ordinance for specific

information regarding Nonconforming Uses and Structures.

Right-to-Farm provisions are discussed in Chapter Four of this document.

Calculation of Land Use Intensities and Allowable Square Footages

Future project-specific development applications will be based on the maximum allowable net square footage for a particular parcel or parcels. The maximum allowable square footage for a particular parcel will be calculated by multiplying the surveyed net developable area (in acres) comprising the subject parcel by the allowable Floor Area Ratio (FAR) for the associated land use designation. The acreage used in this calculation may vary slightly from the acreage shown in the Land Use Map and Table 2.1 and will be determined by more accurate survey and boundary data and the final street alignments and right of way width.

The CLSP-2 Amendment contemplates Limited Industrial development at an average rather than a maximum Floor Area Ratio (FAR) as specified in Table 2.1. Specific development sites will likely develop at a target FAR of 0.75 or lower depending on parking demand, landscaping and open space, stormwater management, and other site requirements.

Land Use and Site Layout Flexibility

The Land Use Map (Figure 2.1) illustrates the general locations and distribution of land uses in the Plan Area as described earlier in this chapter. This Land Use Plan is diagrammatic and does not necessarily represent final road alignments, land use configurations or acreages.

The CLSP-2 Amendment land uses may be further refined in conjunction with the processing of future parcel maps and site plan applications, without requiring a Specific Plan Amendment as further discussed below. Given that the Land Use Map is conceptual in nature,

the CLSP-2 Amendment provides flexibility with respect to the location, design, and detailed implementation of the Land Use Plan during the City’s reviews of future detailed applications. Land Use and Site Design flexibility may include, but is not limited to, the following:

- Relocating collector roads and/or intersections to correspond to existing property lines,
- Relocating collector roads and/or intersections to accommodate a specific development program, building product types, or parcel layout arrangement,
- Relocating collector roads to allow for more efficient use of parcelization for building and parking areas on-site,
- Minor deviations in land use intensity (Floor Area Ratio) and development standards for particular projects, with the concurrence of reviewing agencies, as determined by CDD and if compatible and consistent with the purpose and intent of the Specific Plan
- Allowance for use types not specified in Lathrop’s Zoning Ordinance, which are compatible and consistent with the purpose and intent of the land use designation and zoning classification (to be approved by the Community Development Director)
- Adjustments to travel lanes as supported by traffic studies.
- Acceptability of final land use and site layouts will be evaluated based upon the following criteria/findings:
 - Consistency with the prescribed land use development and design standards, in accord with the CLSP-2 Amendment to the Specific Plan,
 - Building, parking, and site design consistency for each land use parcel as

described in the Design Guidelines (Chapter Seven),

- Consistent application of the stated principles set forth in the CLSP-2 Amendment and the City General Plan,
- Potential economic benefits of a particular land use, building type, site feature, configuration of buildings, road alignment, or other deviation from the Specific Plan that would outweigh the benefits of strict adherence to the CLSP-2 Amendment development standards and Zoning Code, and/or
- The employment benefit of a land use, configuration, or other factor within the CLSP-2 Plan Area which deviates from the CLSP-2 Amendment.

Refer to Chapter 8: Implementation for more information regarding site plan and land use flexibility at the site plan review stage including project review procedures, development agreements, specific plan amendment procedures, enforcement, mitigation monitoring, and other review and approvals required during the implementation of the CLSP-2 Amendment.

Land Use Regulations and Development Standards

The CLSP-2 Amendment is consistent with the 2022 General Plan land use designations as listed below and consistent with the development standards in the Lathrop Zoning Ordinance and the Warehouse Good Neighbor Guidelines.

Limited Industrial (LI) Development Standards

The Lathrop Zoning Ordinance specifies the minimum lot area, lot width, setbacks, and other development standards for the Limited Industrial (LI) designation. Limited Industrial developments shall be further subject to the design guidelines in Chapter Seven.

Open Space (OS) Development Standards

The Lathrop Zoning Ordinance includes development standards for the Open Space (OS) designation. Open Space uses may also be subject to design guidelines contained within Chapter Seven.

Park Development Standards

The Zoning Ordinance defines the development standards for the Park designation. Park uses may also be subject to design guidelines contained in Chapter Seven.

Chapter Three: Circulation and Transportation

Introduction

This chapter describes the proposed circulation system and transportation improvements included in the CLSP-2 Amendment Plan Area.

The Circulation Plan is designed to allow for efficient circulation to and from the CLSP-2 Amendment Plan Area. The plan provides for multiple modes of transportation including automobile, truck, bus transit, bicycle, and pedestrian. This chapter provides the requirements of Plan Area roadways, bikeways, and walkways as well as public transit. The implementation of the CLSP-2 Amendment will provide additional roadway, bus transit, bicycle, and pedestrian linkages between the Plan Area and the surrounding communities, improving connectivity within this portion of the City.

The Circulation Plan provides connections to existing and future roadways as identified in the City of Lathrop's General Plan Circulation Diagram. These connections provide both regional and local mobility between land uses within and adjacent to the Plan Area. It is the intent of the Circulation Plan to comply with the requirements of the Surface Transportation Assistance Act (STAA). The phasing and financing of the proposed roadway improvements is summarized in Chapter Nine Financing Plan.

Circulation and Transportation Goals

The transportation system for the CLSP-2 Amendment Plan Area provides a multi-modal network that serves the needs of all the proposed land uses in the Plan Area by establishing an integrated, efficient, and safe circulation system for transit and vehicles; linking roadways and transit routes in the Plan Area to the City's existing transportation network, and providing

an interconnected system of trails, which are pedestrian and bicycle friendly.

Existing Conditions

On-Site Roadway Network

Land uses at the time of the CLSP-2 Amendment approval are agricultural and large lot/rural residential parcels. Because of this land use pattern, the existing roadway network is sparse with one north-south roadway (Manthey Road) and two east west- roadways (De Lima Road and Dos Reis Road).

Manthey Road is a paved two-lane roadway that parallels I-5 from the CLSP-2 Amendment Plan Area and continues North towards the Roth Road interchange and beyond. This roadway has no curb and gutter with minimal shoulders. De Lima Road and Dos Reis Road are two-lane roadways that extend west from Manthey Road to the San Joaquin River levee. The roadways have shoulders but no curb and gutter.

See Figure 3.1 for Existing Circulation Plan.

Off-Site Roadway Network (Regional Area)

There are a number of major regional roadways that are located in close proximity to the CLSP-2 Amendment Plan Area. These roadways include Interstate 5, Interstate 205, State Route 120, and State Route 99. These roadways are outside of the Plan Area but will be utilized by vehicles entering and exiting the CLSP-2 Plan Area.

Interstate 5, one of the major freeways in the state of California, forms the eastern boundary of the CLSP Plan Area. In San Joaquin County, I-5 connects Stockton to Tracy and passes through Lathrop. Given its location, I-5 will serve as one

of the primary routes for traffic entering and exiting the Plan Area.

There are three freeway interchanges adjacent to the Plan Area. The first interchange, Louise Avenue/River Islands Parkway, is located to the south and provides access to the CLSP Plan Area, Mossdale Village and River Islands. The second interchange, Lathrop Road/Spartan Way, is located in the middle of the overall CLSP and provides direct access to the Plan Area. The third interchange, Roth Road, is located north of the CLSP-2 Amendment Plan Area, and will be the primary point of access for trucks to the Plan Area. A study of the Roth Road corridor from Manthey Road to State Route 99 is being conducted by San Joaquin County, through the San Joaquin Council of Governments (SJCOG) at the time this CLSP-2 Amendment is being written. It is anticipated that the ramps will be widened, and traffic signals will be installed in the future.

Interstate 205 lies to the south of the City of Lathrop and provides a connection to the City of Tracy and the San Francisco Bay Area.

State Route 120 is another major regional roadway in San Joaquin County and provides a connection from I-5 and I-205 to State Route 99, south and east of the Plan Area. SR 120 will serve as a likely access route for trips accessing the Plan Area from Manteca. The I-5/SR 120 interchange located South of the Plan Area provides a connection between these two roadways through a system of ramps.

State Route 99 is a regional roadway in the regional area. This roadway serves as one of the major north-south routes in San Joaquin County and provides a connection between the City of Stockton in the north and Manteca in the south. SR 99 continues south through Stanislaus County and parallels I-5 throughout much of California.

Existing Bicycle and Pedestrian Network

There are essentially no existing bicycle or pedestrian facilities in the CLSP-2 Amendment Plan Area. However, there are pedestrian and bicycle facilities in the CLSP Phase 1 area and in the adjacent specific plan areas including Mossdale Village and River Islands that will be connected to the planned facilities within the CLSP-2 Amendment Plan Area at Golden Valley Parkway and Stanford Crossing as displayed on Figure 3.10 Pedestrian and Bicycle Circulation Plan.

Existing Transit Network

The City of Lathrop does not operate any local serving transit routes. However, there are transit routes that operate in the regional area. These routes include fixed-route regional bus service and flexible fixed route bus service. The San Joaquin Regional Transit District (SJRTD) operates the bus routes while Altamont Commuter Express operates the commuter rail service. These transit services are described in detail below.

SJRTD Fixed-Route Service

The SJRTD operates two fixed-route bus lines (Route 290 and 97) that serve the City of Lathrop. Route 97 connects Manteca Transit Center to Tracy Transit Center through Lathrop via Louise Avenue and Interstate 5. Route 97.Route 90 connects Lathrop to Stockton and Tracy via Interstate 5. The route map for Route 90 and 97 are shown on Figure 3.2. These routes include several existing bus stops within Lathrop's City limits. An additional proposed bus stop is suggested at Manthey Road just south of De Lima Road to serve commuters to the CLSP-2 area. This suggested stops are shown on Figure 3.4.

SJRTD Flexible Fixed-Route Service

SJRTD also operates Route 90, which is a flexible fixed-route line. A flexible fixed-route bus operation follows a general route but can deviate within limited areas to pick-up or drop-off passengers. This line links the City of Lathrop

with Stockton and Tracy via a route that provides access into the City of Lathrop by Lathrop Road and Louise Avenue.

SJRTD Commuter Bus Service

The SJRTD operates a number of commuter bus lines which connect cities in San Joaquin County with major employment locations in the San Francisco Bay Area including Pleasanton, Dublin, Livermore, Mountain View, Palo Alto, and Sunnyvale. The existing Commuter Bus service in Lathrop connects Lathrop to the Dublin/Pleasanton BART station and also Sunnyvale. Commuters access the bus service at the Lathrop Park and Ride Lot south of the Plan Area, which is located between Lathrop Road and Louise Avenue on 5th Street.

Altamont Commuter Express Rail Service (ACE) & Valley Link

Altamont Commuter Express Rail Service
Altamont Commuter Express (ACE) is a passenger rail service connecting Stockton to San Jose. The closest ACE station to the Plan Area is located on the border of the City of Lathrop and the City of Manteca to the north of SR 120.

Valley Link is a new 42 -mile, 7-station passenger rail project connecting BART's rapid transit system in the Bay Area's Tri-Valley and the ACE Commuter Express (ACE). Future Valley Link/ACE Stations are anticipated at two locations within City limits. One proposed location near the River Islands development North of Highway 5 along the Union Pacific Railroad. A second location is proposed in North Lathrop at Lathrop Road along the Union Pacific Railroad and McKinley Avenue.

Existing Truck Routes

Existing truck routes within the vicinity of the Plan Area, including STAA truck routes and non-STAA truck routes are shown on Figure 3.3.

Figure 3.1- Existing Circulation Plan

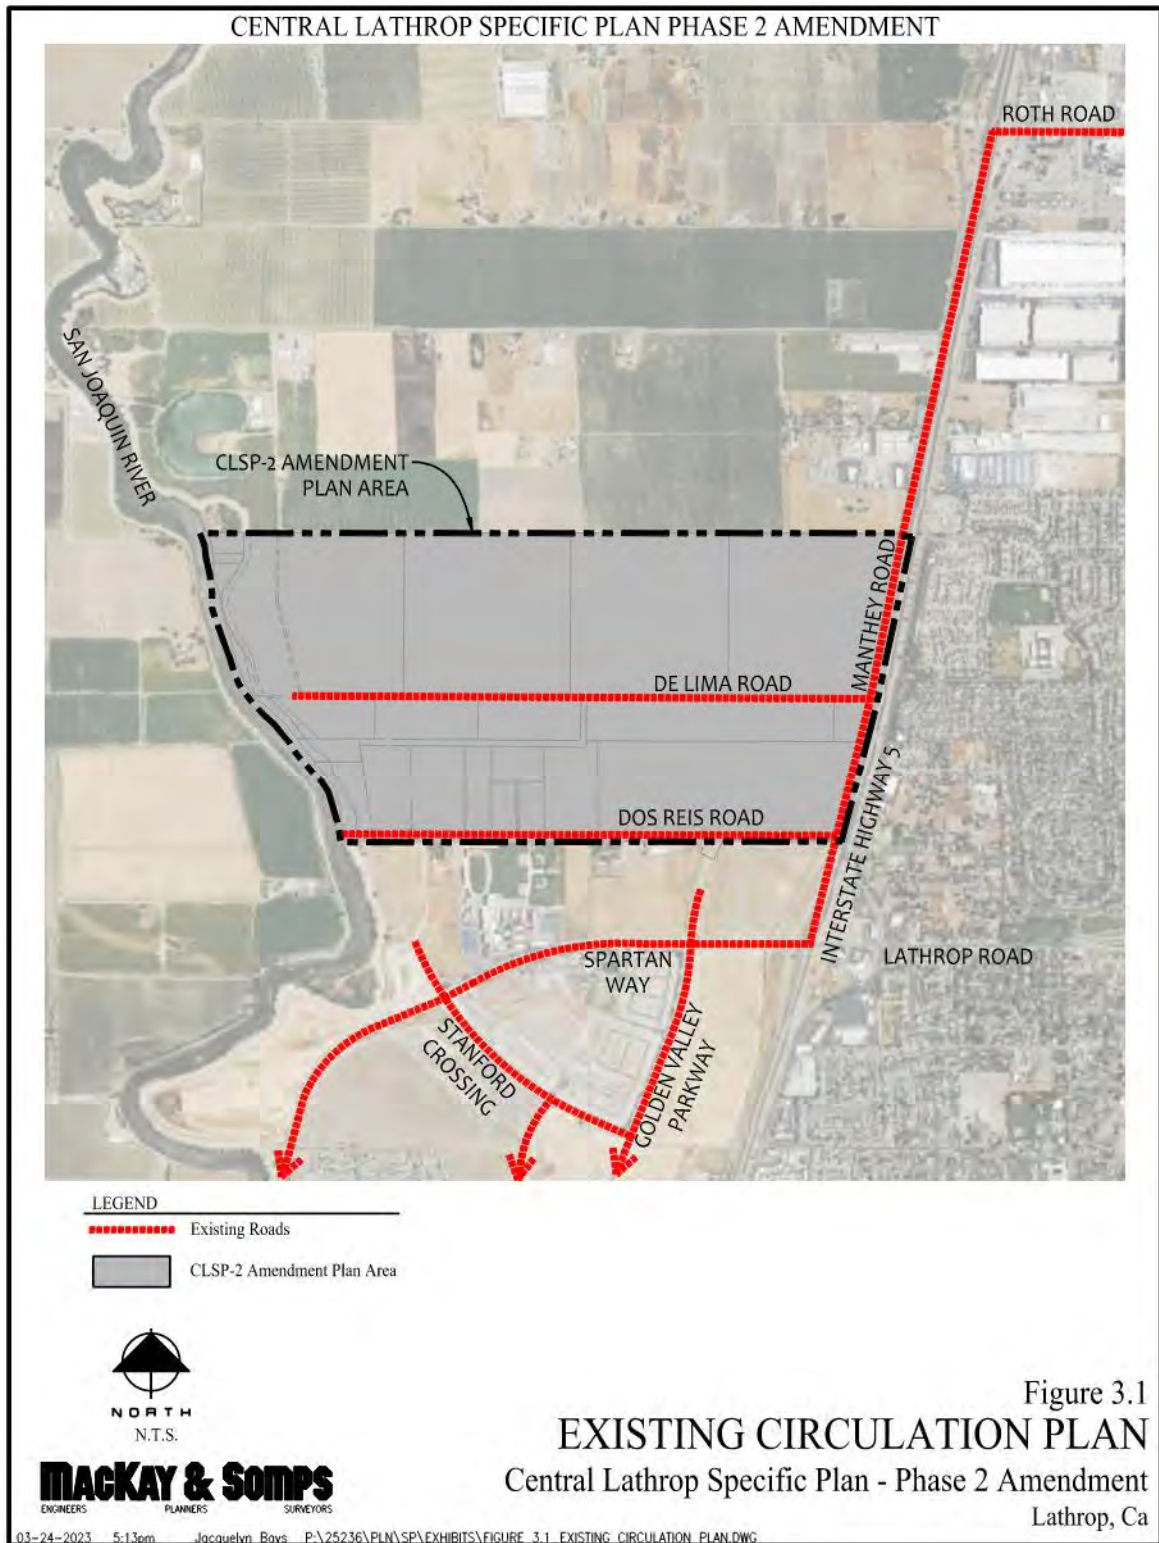

Figure 3.2- Existing Bus Service Plan

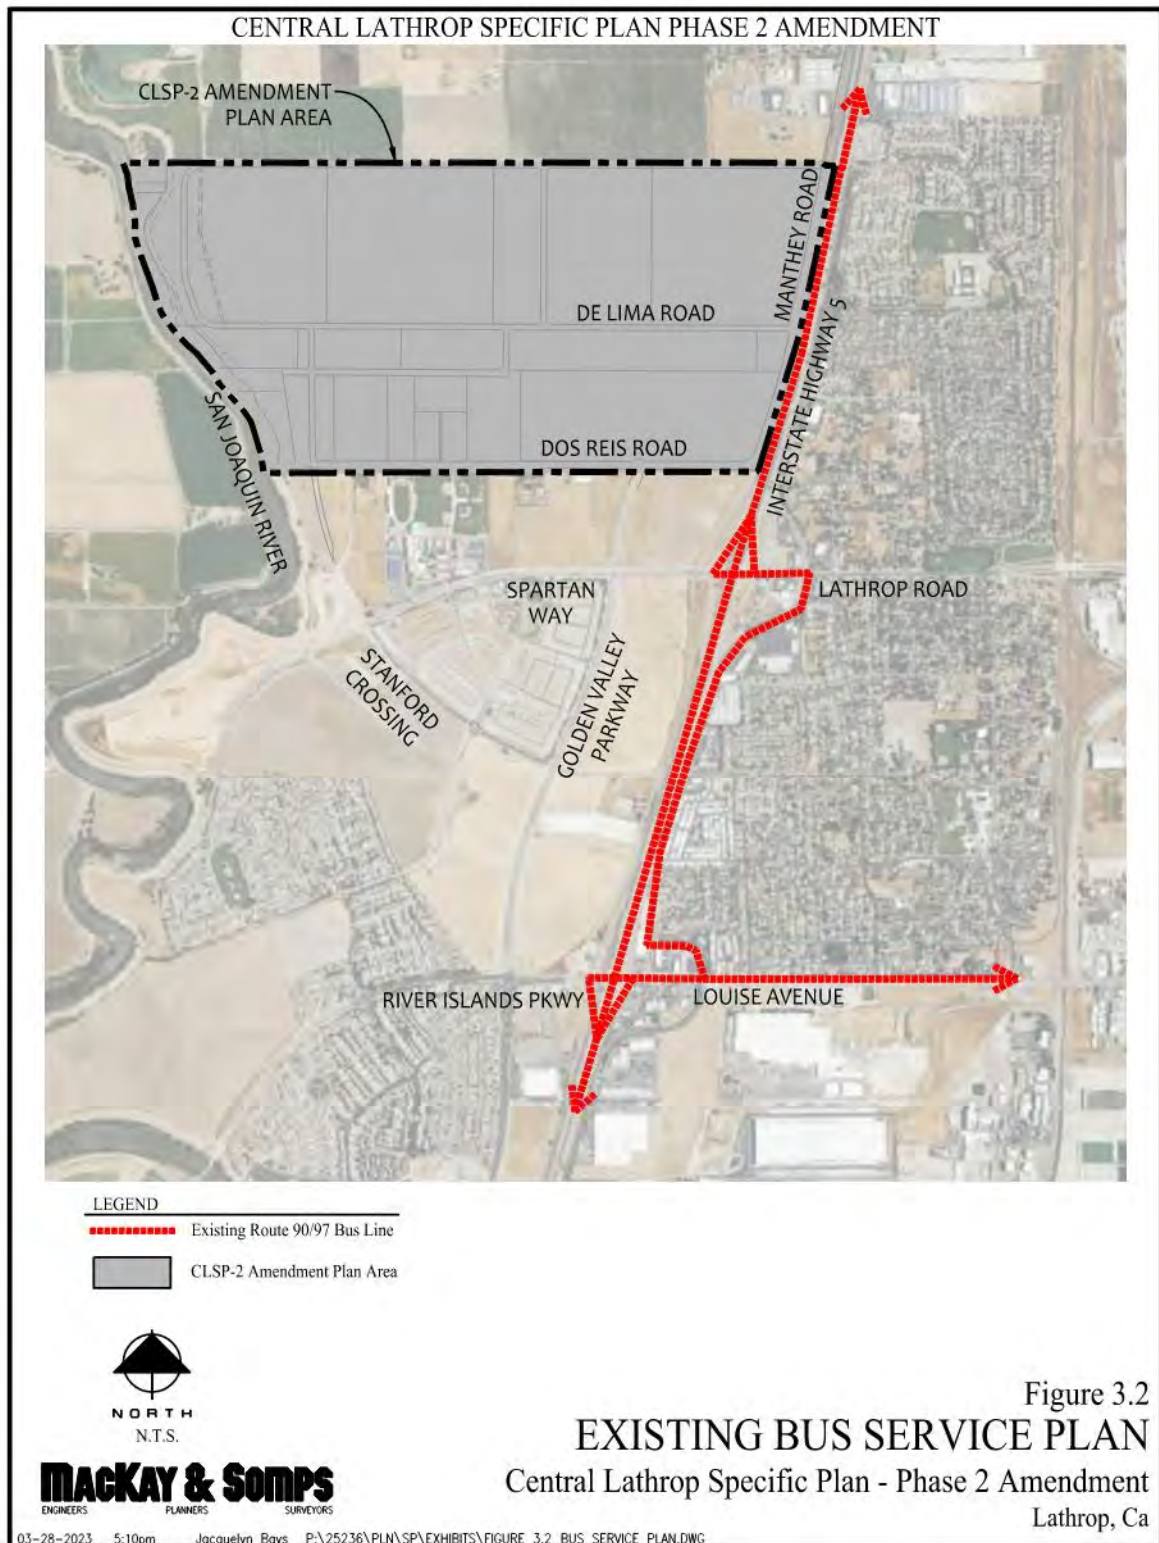

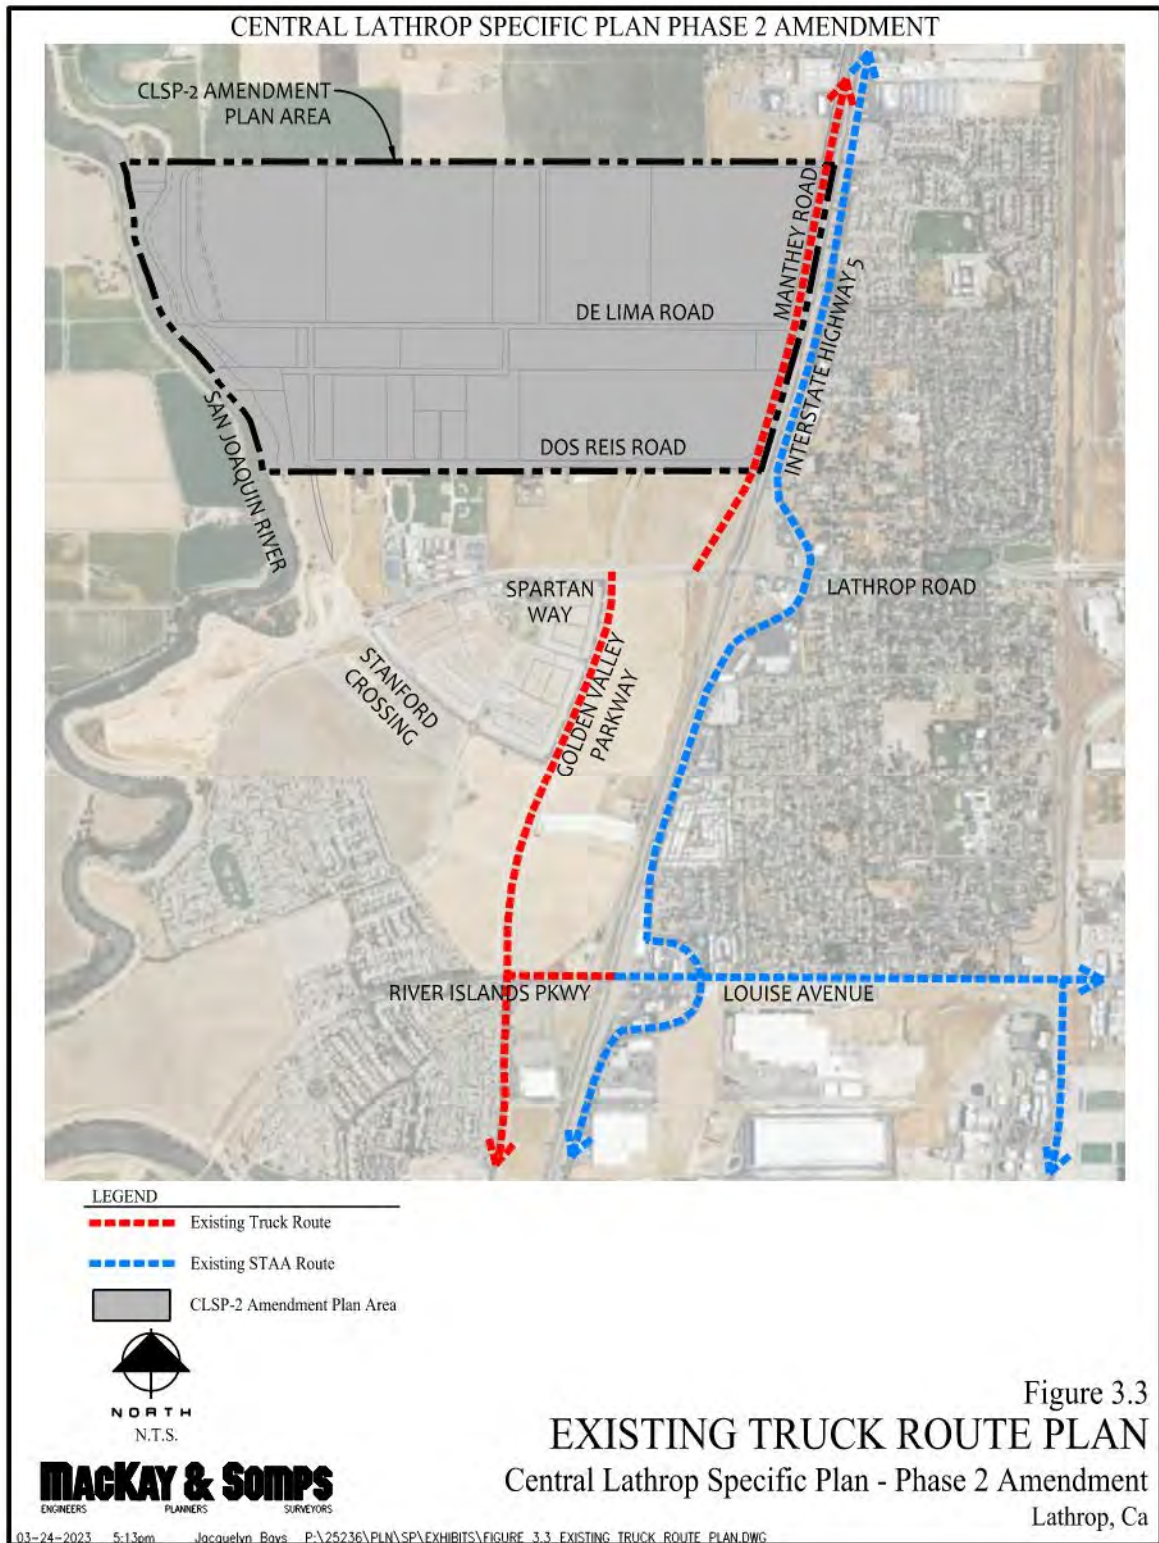

Figure 3.3- Existing Truck Route Plan

Proposed Transportation Improvements

With the anticipated growth in the City of Lathrop and San Joaquin County, both jurisdictions have identified transportation improvement projects in the CLSP-2 Amendment Plan Area and the regional area along with various funding sources.

City of Lathrop

The 2022 General Plan and the various Lathrop specific plans identify near-term and long-term transportation improvements. The City of Lathrop Traffic Monitoring Program (TMP) helps to identify when the near-term projects are required to be constructed based on a level of services analysis. Local funding sources for select transportation improvements include the City of Lathrop Capital Facilities Fee (CFF) Program. Fees collected through the CFF Program can be used to fund or reimburse the construction of new and improved roadways such as:

- Golden Valley Parkway
- Lathrop Road/I-5 interchange
- Louise Avenue/I-5 interchange
- Roth Road/I-5 interchange

Regional Transportation Plan (RTP)

San Joaquin County, through the San Joaquin Council of Governments (SJCOG), periodically updates the Regional Transportation Plan, which outlines countywide transportation expenditures based on funding from sources such as the Federal Government, the State of California, and locally collected funds. These funds typically are allocated to mainline freeway improvements in the region.

Measure K

Measure K sales tax funds additional roadway improvements. The Measure K Strategic Plan provides for the expenditure of these funds.

CLSP-2 Amendment Plan Area Transportation Network

The CLSP-2 Amendment outlines a well-structured network of roadways, bikeways and walkways to serve the CLSP-2 Amendment Plan Area. The circulation system will provide convenient and safe access to all areas within the Plan Area, as illustrated in Figure 3.4, Vehicular Circulation Plan. A well-connected hierarchy of travel modes will provide for the efficient flow of vehicular traffic, but also encourage and facilitate walking, biking, public transit, and other alternatives to single-occupancy vehicles.

The CLSP-2 Amendment includes connections to the off-street bicycle and pedestrian paths within the CLSP Phase 1 Plan Area. Class I (off-street) bike routes along Golden Valley Parkway are proposed to be extended into the CLSP-2 Amendment Plan Area and transition into Class II bike lanes throughout the local industrial streets. Class I (off-street) and Class II (on-street) bike routes along Stanford Crossing are proposed to be extended into the CLSP-2 Amendment Plan Area. To encourage pedestrian trips within the CLSP-2 Amendment Plan Area and to surrounding areas, all arterial and local streets include sidewalks.

The Traffic Impact Analysis prepared with the 2022 General Plan provides the basis for the number of lanes required based on a level of services analysis.

Roadways

The CLSP-2 Amendment Plan Area includes several new roadways within an interconnected roadway system. These new roadways, along with improvements to existing roadways, provide the necessary access for the Plan Area. The roadway network is shown on the Vehicular Circulation Plan (Figure 3.4), while the locations of each individual street section are identified on the Street Sections Key Map (Figure 3.5).

The proposed CLSP-2 Amendment roadway system is based on a pattern of streets that provides safe and efficient access for vehicles, bicycles and pedestrians. The roadway system includes an extension of Golden Valley Parkway and Stanford Crossing, widening of Dos Reis Road, De Lima Road, and Manthey Road, and the construction of several new local industrial roads consistent with the 2022 Lathrop General Plan. The addition of traffic signals may be required at various intersections as determined for future specific project developments in the CLSP-2 Amendment Plan Area.

Generally, the proposed Phasing and Capital Improvement Program will fund and construct full roadway improvements curb-to-curb and required street lighting for roadways from intersection to intersection as specific development proposals in the CLSP-2 Amendment Plan Area trigger the need for these roadway segment improvements. The approach to and the timing of roadway improvements should be logical and comprehensive as to accommodate development phases and demands, while avoiding piecemeal improvements within the CLSP-2 Amendment Plan Area.

Functional classification systems divide roadways into a hierarchy based on their ability to serve traffic and provide access to development.

Arterials – These roadways are intended to serve as the major routes of travel. Arterials are designed to link facilities such as freeways and expressways (which prioritize the movement of through vehicles) with lower hierarchy roadways, which provide direct access to parcels. Arterials can provide some level of direct access with limitations. These limitations can include restrictions on spacing and turn movements into and out of driveway locations. Arterials can also serve as bicycle and pedestrian routes.

Collectors – These roadways serve as intermediate links between arterials and local roads. Traffic is collected from local roads and distributed onto

the arterial system. Collector roadways also provide direct access to parcels. Collector roadways can be classified as both major collectors and minor collectors. Collectors in the Plan Area generally have two lanes with a center turn lane/median, though additional lanes may be provided at intersections to provide sufficient intersection capacity.

Local Roads – Local roads provide direct access to parcels and connect to collectors. Traffic volumes on these roads are low and through traffic is discouraged.

CLSP-2 Amendment Plan Area Truck Routes

The 2022 General Plan prohibits Golden Valley Parkway and Dos Reis Road within the CLSP-2 Amendment Plan Area from being designated as truck routes. Manthey Road is the designated truck route connecting the CLSP-2 Amendment Plan Area to the Roth Road interchange north of the CLSP-2 Amendment Plan Area. In addition, the local industrial streets within the CLSP-2 Amendment Plan Area are proposed to be designated as truck routes as illustrated in Figure 3.11. Truck access is prohibited on Dos Reis Road and Manthey Road south of Dos Reis. Refer to the Lathrop Municipal Code Chapter 10.16 Truck Routes and Commercial Vehicles for details regarding designated truck routes.

Figure 3.4- Vehicular Circulation Plan

Figure 3.5- Street Sections Key Map

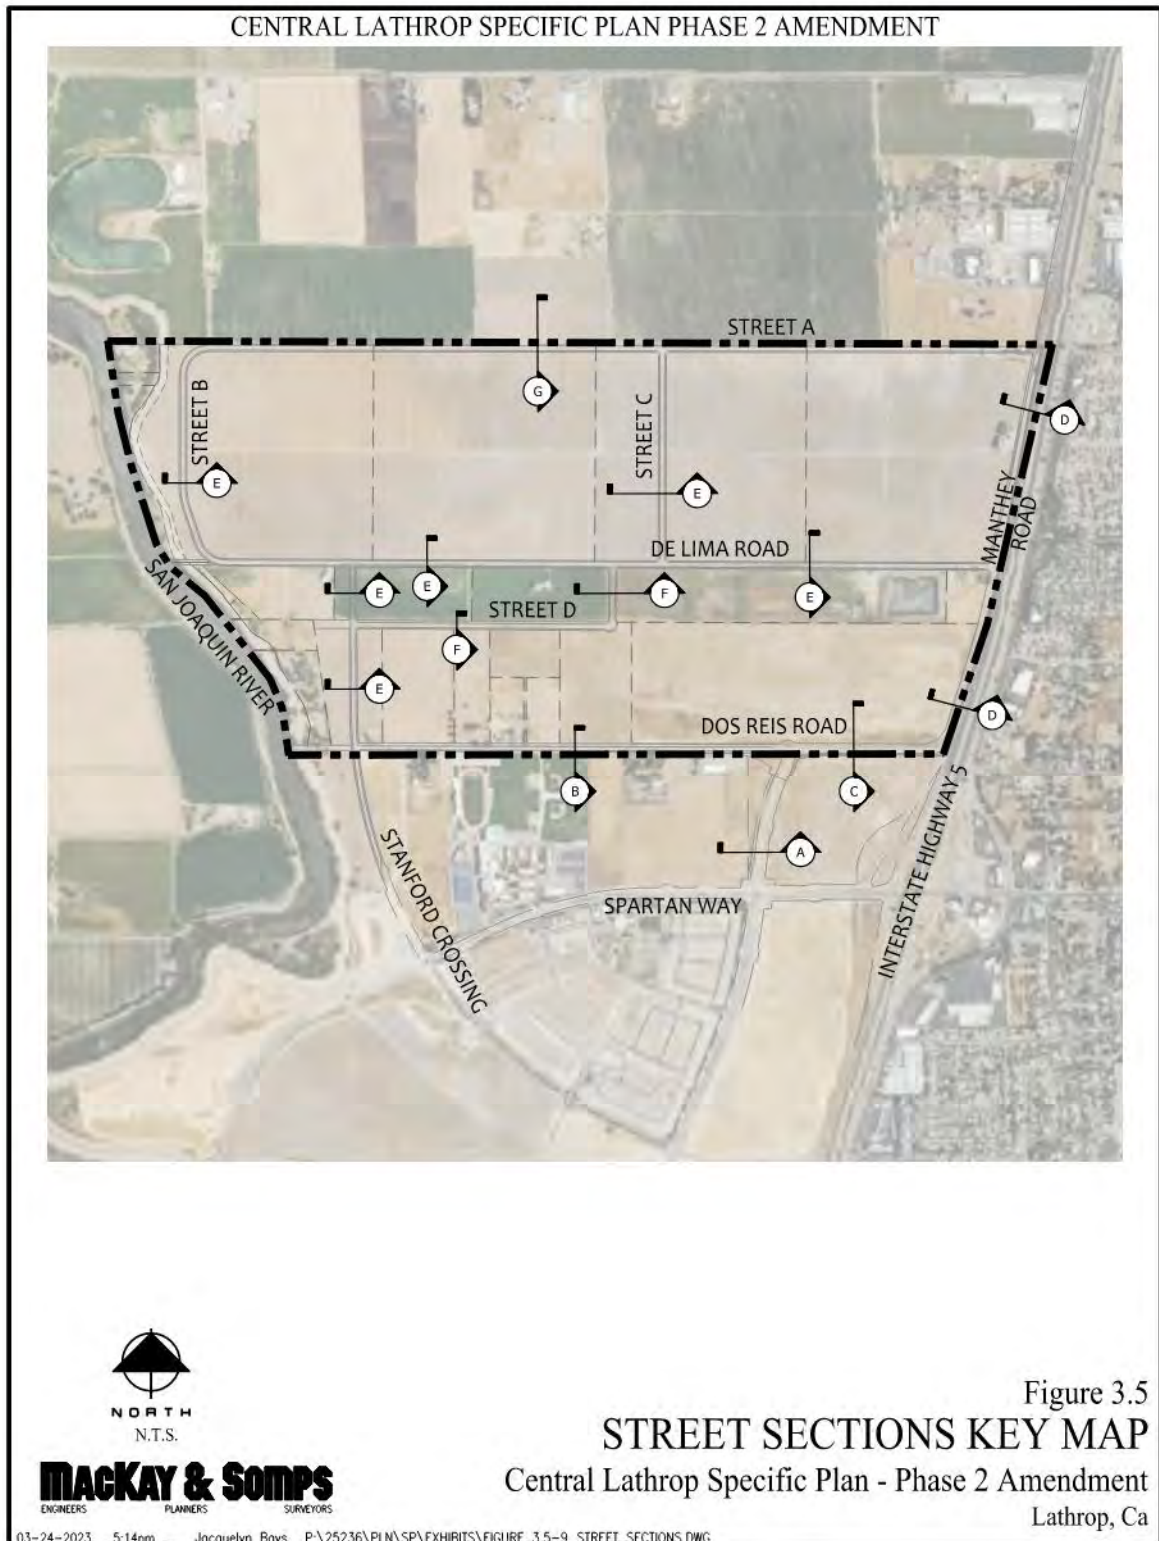

Figure 3.6- Street Sections

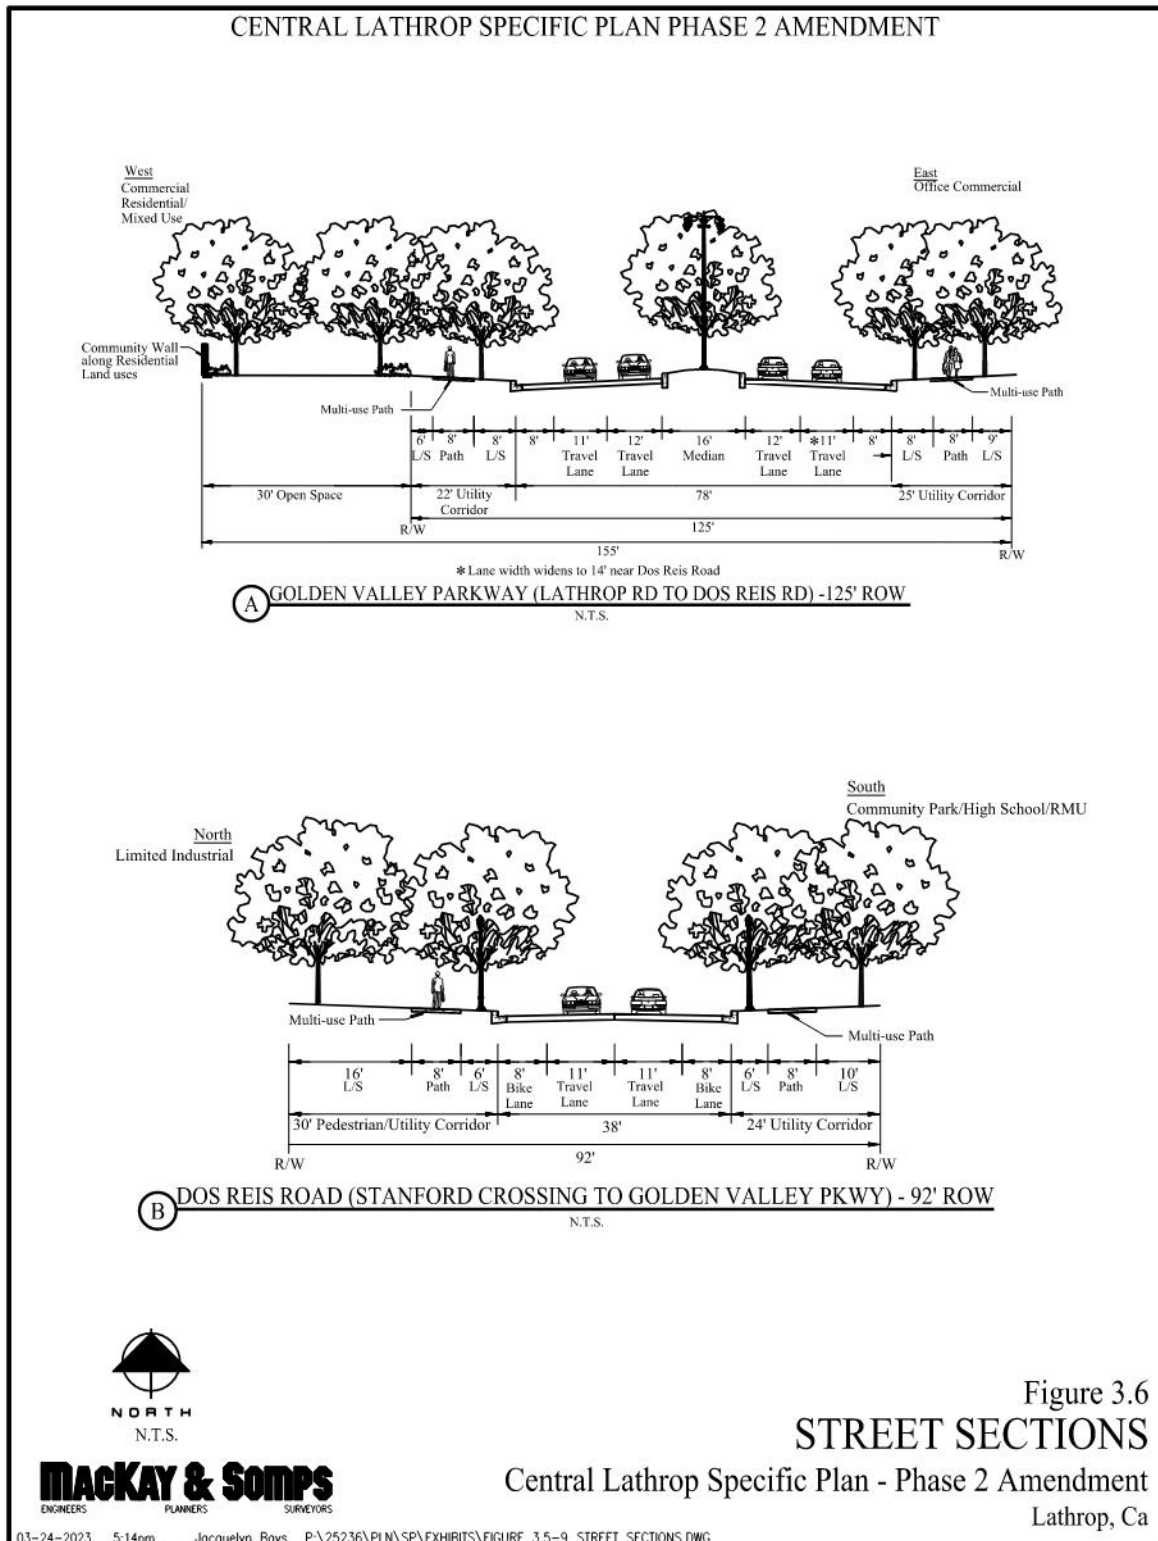

Figure 3.7- Street Sections

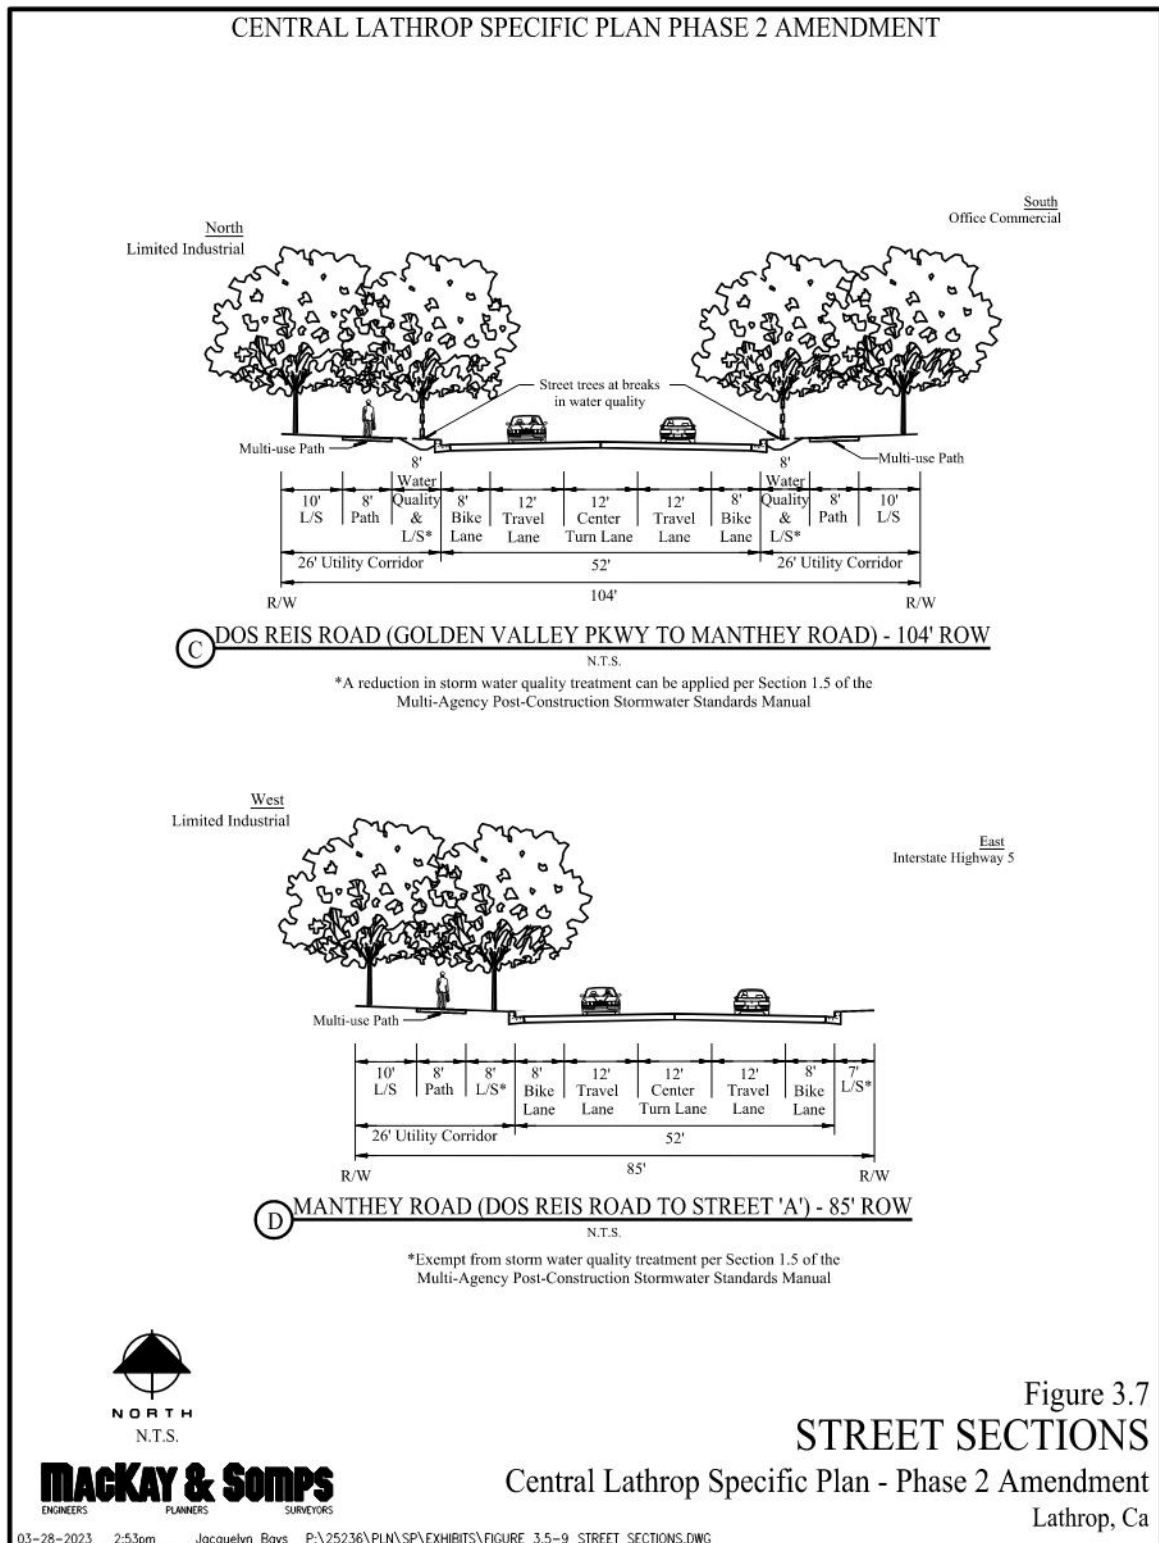

Figure 3.8- Street Sections

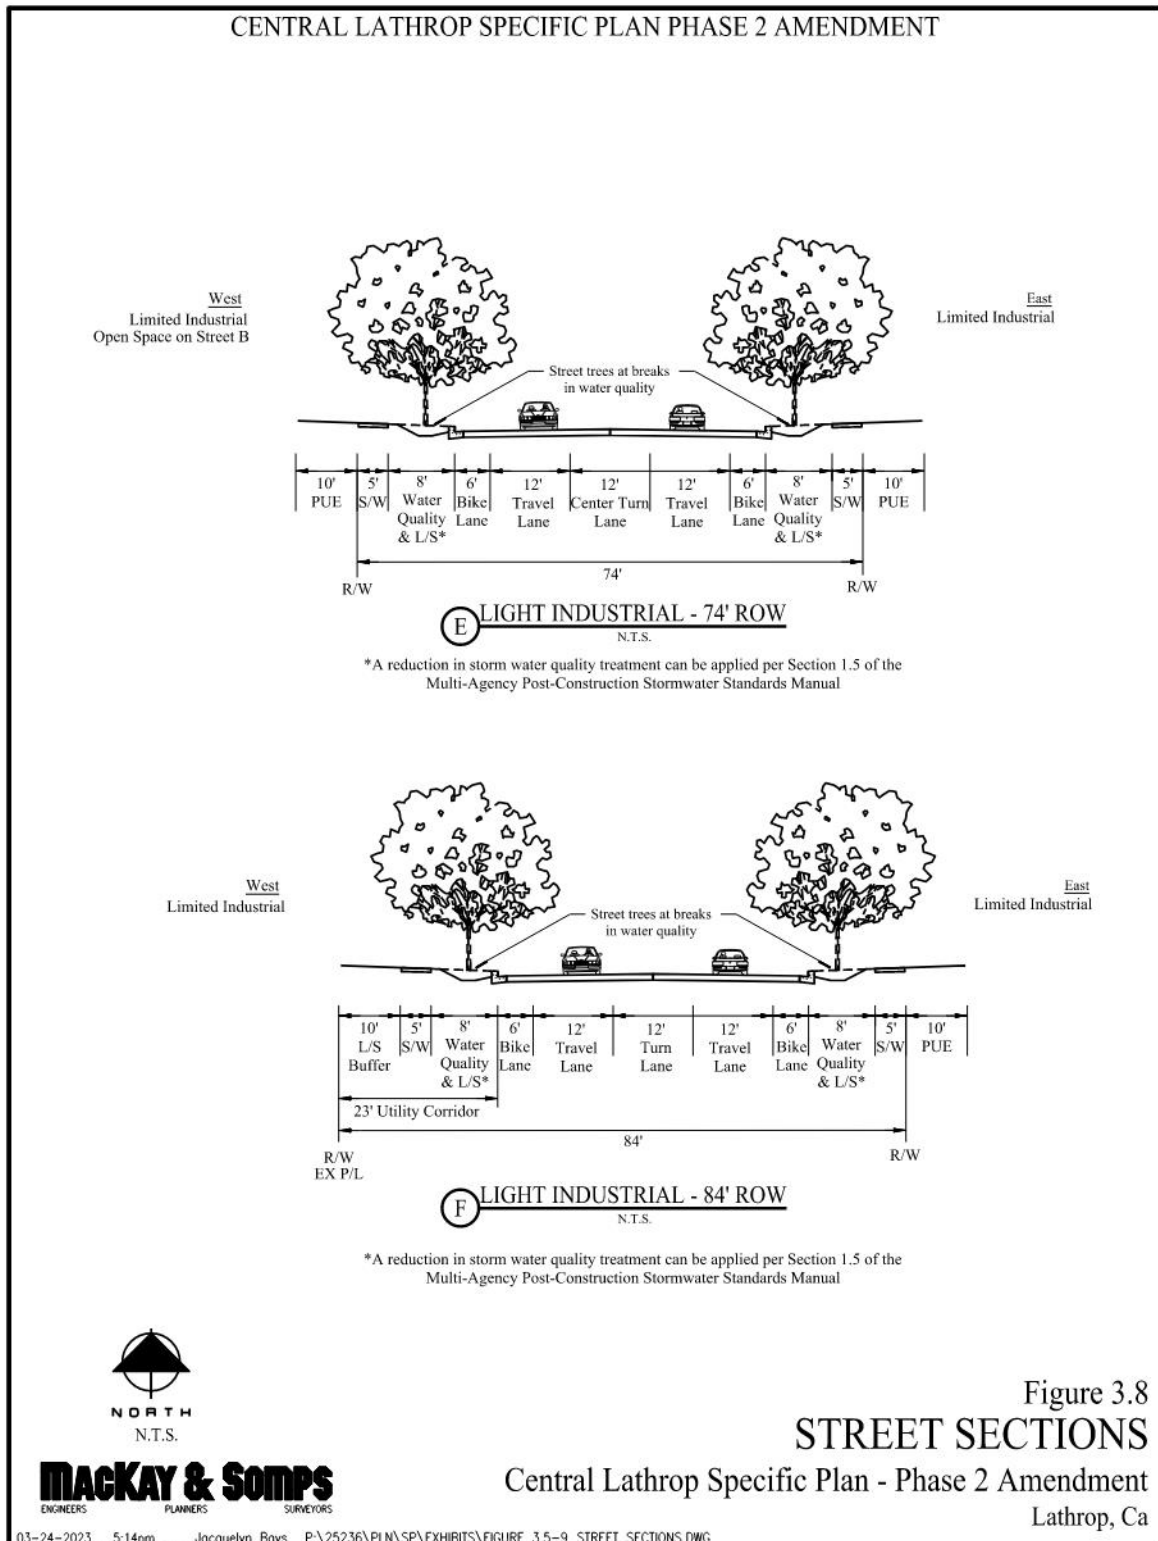

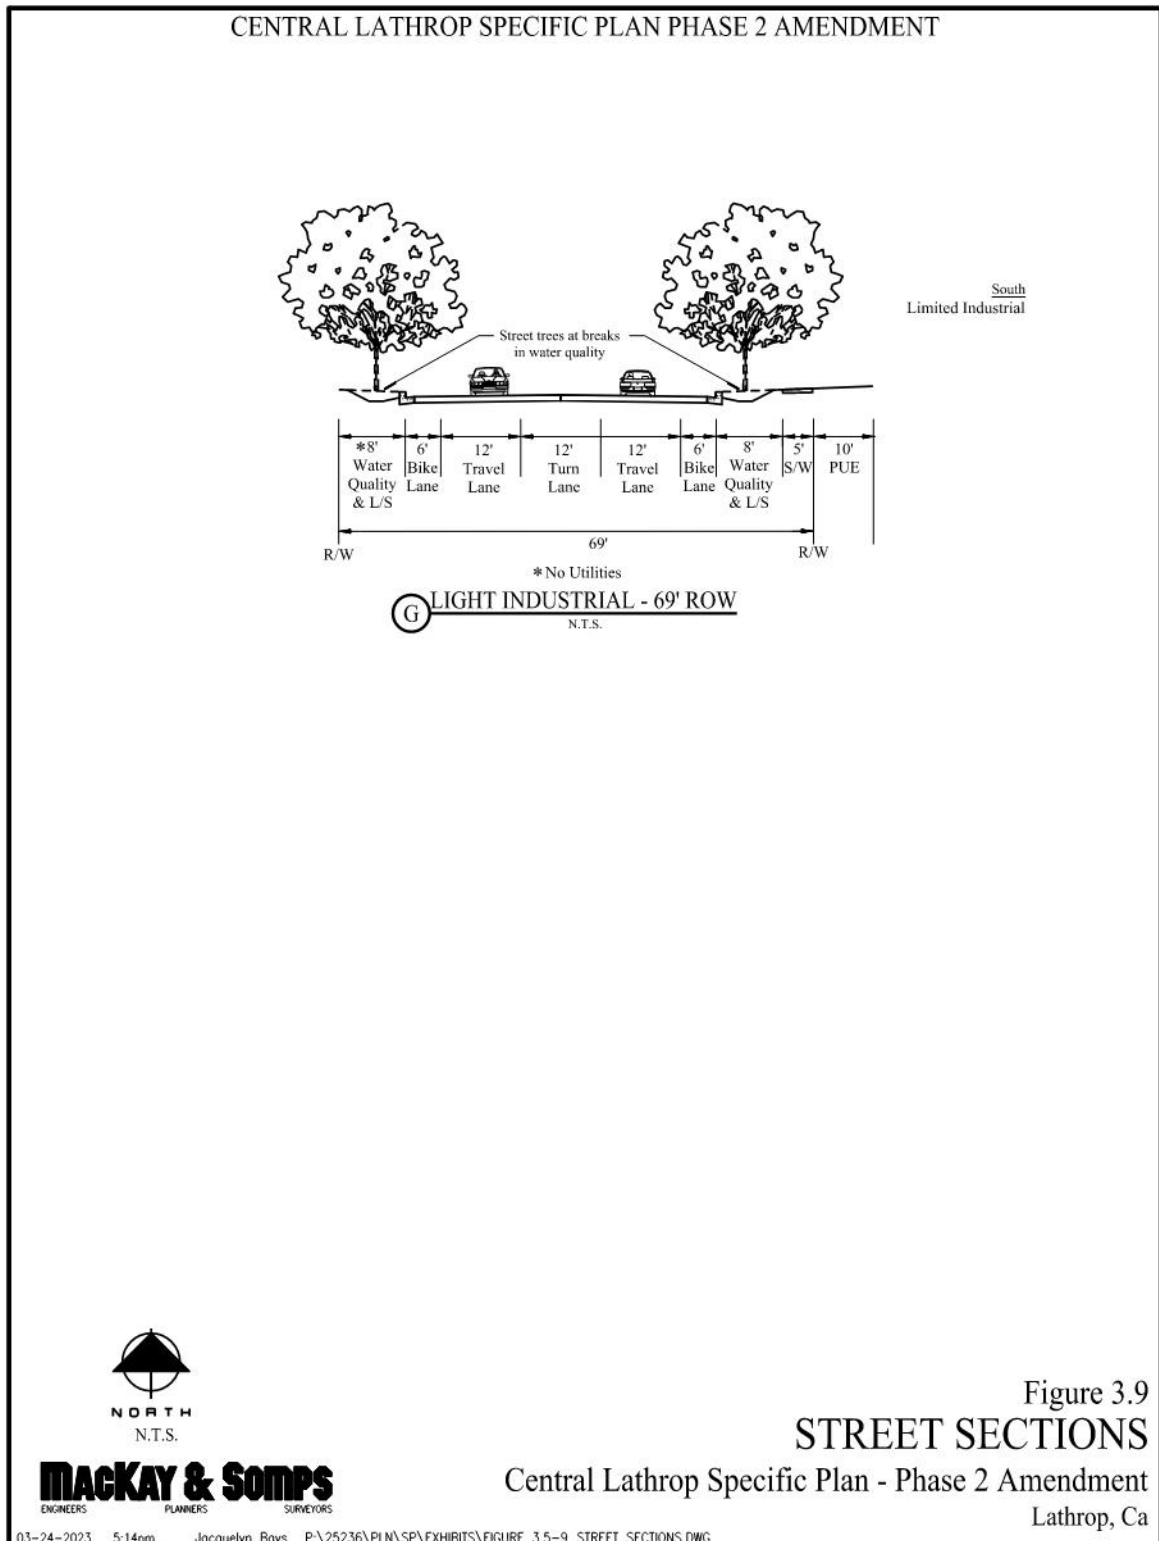

Figure 3.9- Street Sections

Utility Corridors

As shown on the CLSP-2 Amendment Roadway Vehicular Circulation Network and street sections, many of the streets within the CLSP-2 Amendment Plan Area include utility corridors within the public right-of-way. The purpose of utility corridors is to provide a location for the installation of joint trench utilities (power, gas, telephone, cable T.V. and other similar dry utilities).

The mainline joint trench will be installed beneath the multi-use path or sidewalk. The area between the curb and the multi-use path/sidewalk is envisioned to be used for the placement of underground vaults and structures such as splice boxes, transformers and other similar equipment. In instances where these structures cannot be constructed underground, the portion of the utility corridor located behind the multi-use path/sidewalk to the right of way line is envisioned to be used for above ground cabinets, where they can be placed away from the travel way and where landscaping can be used for visual screening. If there is not adequate space for above ground cabinets in the utility corridor behind the multi-use trail/sidewalk, then a public utility easement may be added for this purpose.

Utilities that are typically owned and maintained by the City (such as sewer, water, recycled water and drainage systems) are intended to be placed under the paved roadway sections. However, in some instances, the City Engineer may approve the use of utility corridors for the placement of these utilities. This situation might occur if there is not adequate room to meet separation requirements between the utilities within the paved section. It may also occur if phasing of construction requires early placement of pipelines (before roadway improvements) and the risk of subsequent damage to the pipeline during road construction justifies.

Bicycle and Pedestrian Network

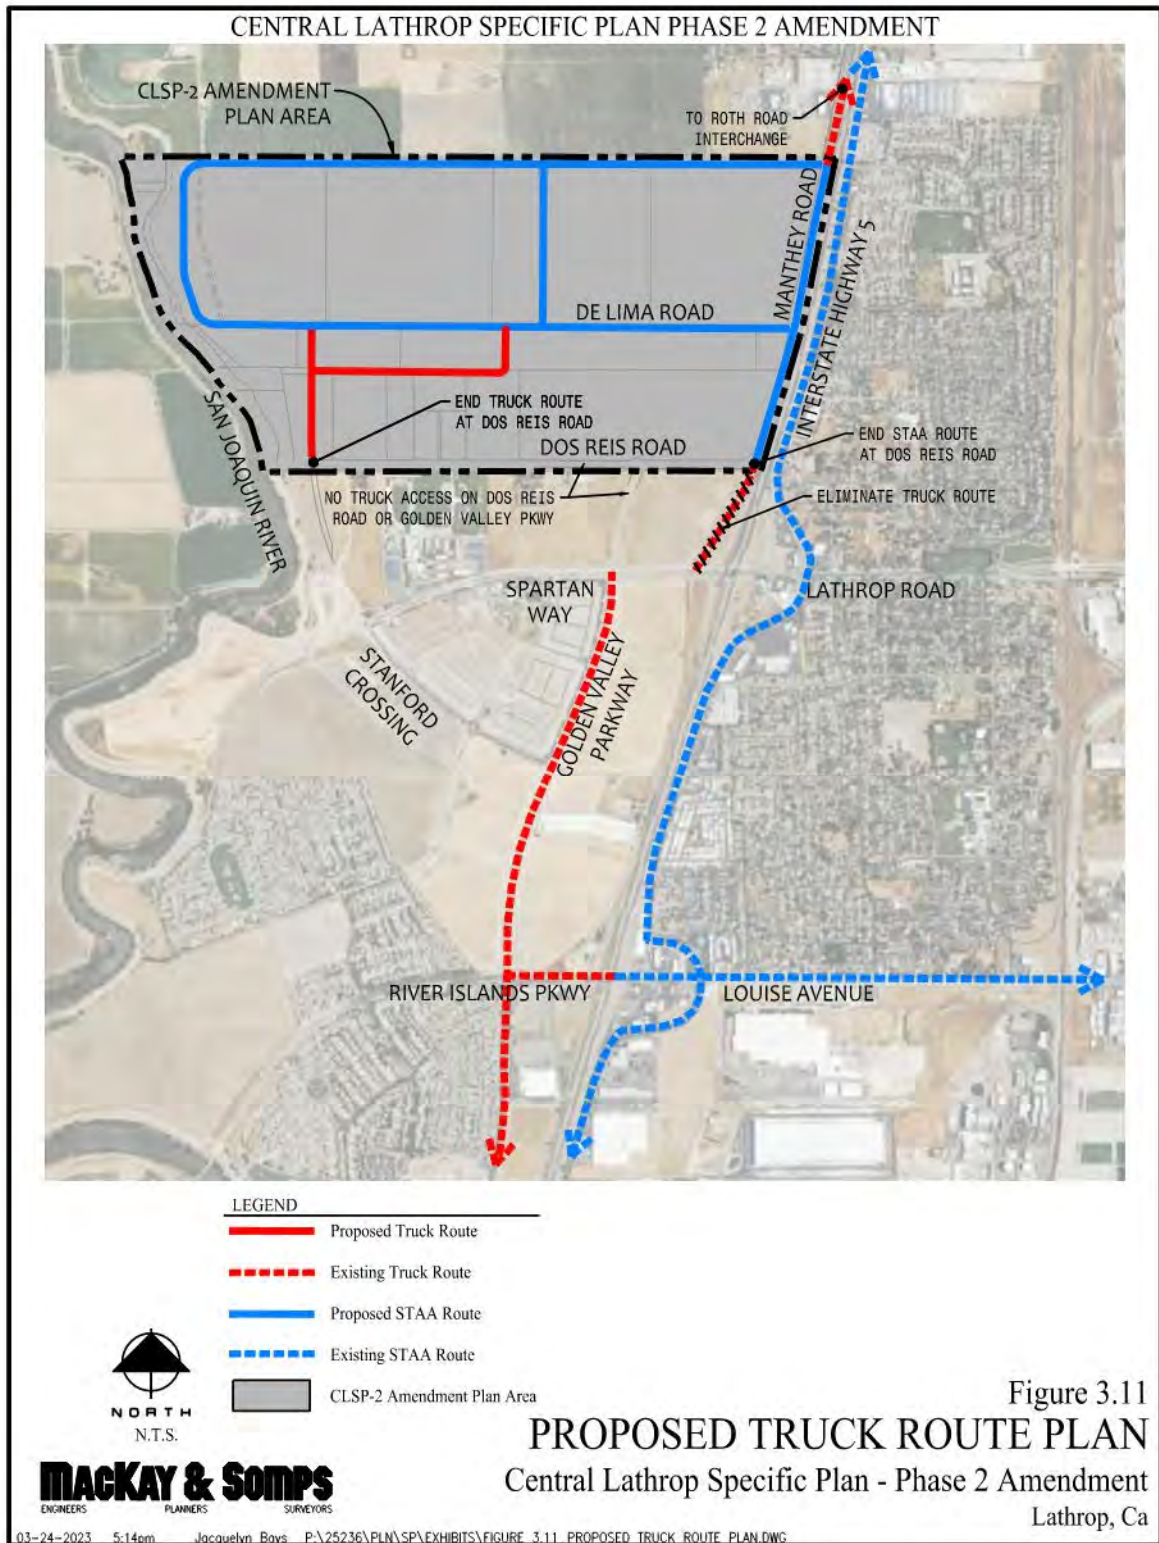

The CLSP-2 Amendment Plan Area provides a comprehensive and extensive system of integrated bicycle and pedestrian paths and sidewalks. This system connects residential neighborhoods, public facilities, open spaces, and commercial areas with the limited industrial use. Major elements of this network include both off-street and on-street facilities. Refer to Figure 3.10 for the Pedestrian and Bicycle Circulation Plan. Improvements such as driveways shall be designed to maintain a safe environment for pedestrians and bicycles and to avoid conflicts with truck traffic.

The off-street facilities include eight-foot-wide paved multi-use paths located adjacent to arterials and some of the collector roadways. A multi-use trail adjacent to the San Joaquin River levee if approved by the City of Lathrop and Reclamation District- 17. Other off-street facilities include dedicated sidewalks.

Figure 3.10- Pedestrian and Bicycle Circulation Plan

Figure 3.11- Proposed Truck Route Plan

Chapter Four: Natural Resources Management

Introduction

This chapter addresses the natural resource opportunities of the CLSP-2 Amendment Plan Area and how they are integrated and managed for their preservation and benefit of the community. Additionally, this chapter identifies and discusses how other facilities may be integrated into the CLSP-2 to provide for the provision of new natural resource systems.

Open Space and Parks

The CLSP-2 Amendment makes extensive use of dedicated open space to create an integrated and interconnected resource management system. The preservation and management of existing natural resources within and adjacent to the CLSP Plan Area and the establishment of new natural resource systems are a principal feature of the CLSP-2. Open space can be both privately owned and maintained or publicly owned and maintained. The Open Space and Parks proposed as a part of this specific plan are continuation of the efforts begun with the original CLSP to expand open space and park systems within City limits.

Open Space features include the San Joaquin River and those areas associated with the levee—its side slopes, its top, and the area within close proximity of the outer (land side) levee toe; open space corridors that may contain linear detention basins; and other areas where either natural resources or community design warrants an open space use. Open space areas are typically characterized by the inclusion of internal trail systems.

With the establishment of the linear open space corridor along the river, sensitive riparian

vegetation and habitat will be preserved and protected, except as determined by RD-17 for levee safety or maintenance reasons. Public access to and along the top of the levee may be provided if approved by the City of Lathrop and RD-17, affording the community views of the river and its environs, as well as greater views of the valley.

A linear park also provides open space area within the CLSP-2 Amendment Plan Area. The linear park offers opportunities for passive activities and contributes towards community identity. The park expands upon Dos Reis Park.

Refer to Chapter Five: Community Services and Facilities for more information on parks.

Williamson Act Lands

No parcels within CLSP-2 are under Williamson Act contracts. Parcels that were previously under contract at the time the 2004 CLSP was prepared filed Notices of Non-Renewal and are no longer under the contracts.

Right to Farm

The City of Lathrop has adopted an Agricultural Land Preservation Ordinance, also known as a “right to farm” ordinance, to protect the activities, operations, and facilities associated with agricultural production from encroaching urban uses and conflict. The CLSP EIR identifies mitigation to alleviate potential impacts of development within the CLSP-2 Amendment Plan Area upon functioning agricultural activities. Mitigation is comprised of setback buffers between development and farming activities.

To reduce potential public pressure to restrict agricultural operations that future residents may consider a nuisance, the City requires that a disclosure statement be provided to new homebuyers notifying them of preexisting agricultural land uses within the surrounding area.

Biological Resources

The CLSP-2 Amendment Plan Area is comprised mostly of intensively managed and irrigated agricultural fields with a few large lot homesteads. As a result, natural habitats within the CLSP-2 Amendment Plan Area are restricted to narrow patches of riparian vegetation along the San Joaquin River, marshy vegetation in some agricultural ditches, and scattered individual or small clumps of valley oak trees.

The CLSP-2 Amendment Plan Area vegetation is dominated by cropland and other developed or previously disturbed habitats. A relatively small amount of native vegetation occurs along the San Joaquin River, which borders the western edge of the CLSP-2 area, and within several of the drainage ditches that traverse the area. Vegetation types present in the CLSP-2 Amendment Plan Area are classified according to the categories designated in the SJMSCP. The CLSP EIR describes these categories. Present vegetation categories are cropland, freshwater emergent wetland, Great Valley cottonwood riparian forest, Great Valley oak riparian forest, Great Valley riparian scrub, ruderal, and park/residential.

Some habitat types in the CLSP-2 area could be considered sensitive by regulatory agencies. These include freshwater emergent wetland, Great Valley cottonwood riparian forest, and Great Valley riparian scrub.

Valley elderberry longhorn beetles require blue elderberry shrubs for reproduction and survival.

Although focused surveys for elderberry shrubs have not been conducted, isolated shrubs and

clumps of shrubs have been observed. Based on the presence of blue elderberry shrubs, valley elderberry longhorn beetle could occur in the CLSP-2 Amendment Plan Area.

Several special status raptor species are expected to occur in the CLSP-2 area, including Swainson's hawk, white-tailed kite, and northern harrier. Agricultural fields provide suitable foraging habitats for all of these special-status raptors and the oak and riparian forest communities provide nesting opportunities for tree nesting species.

Riparian brush rabbits have been located in the CLSP-2 Amendment Plan Area. Although riparian brush rabbits occur in the CLSP-2 Amendment Plan Area, the small patches of suitable habitat are unlikely to support a long-term viable population of the species.

The predominance of agricultural lands limits the overall wildlife habitat value of the CLSP-2 Amendment Plan Area and supports a relatively low diversity of wildlife species. However, some species heavily utilize agricultural fields. Alfalfa fields in the CLSP-2 Amendment Plan Area are expected to support small mammals, such as Botta's pocket gopher, western harvest mouse, and California meadow vole. These small mammals are prey for a variety of raptor species known to occur in the CLSP-2 area, including American kestrel, northern harrier, red-tailed hawk, and Swainson's hawk. A variety of other birds were observed or are expected to forage in CLSP-2 Amendment Plan Area agricultural fields, including western kingbird, barn swallow, western meadowlark, and Brewer's blackbird.

Ornamental vegetation and landscaping associated with developed areas, such as rural residences and the County park, also support a relatively low wildlife diversity. These areas are typically utilized by species adapted to highly disturbed and altered environments, such as house sparrow, house finch, raccoon, and opossum.

Wildlife diversity in agricultural ditches is limited due to the regular disturbance of the ditches for clearing and maintenance and the absence of natural vegetation in uplands adjacent to the ditches (e.g., agricultural lands). However, the marsh vegetation in the ditches may support species typical of this plant community such as marsh wren, song sparrow, and Pacific tree frog. Riparian vegetation and oak trees provide nesting habitat for a much wider variety of bird species and also provide potential nest sites for raptors.

The CLSP EIR contains a detailed description of sensitive habitats and wildlife, potential impacts and mitigation measures to alleviate development effects upon these resources.

CLSP-2 Plan Amendment designates some natural habitats as Open Space within the CLSP-2 Amendment Plan Area to assure their preservation. These habitats are located primarily along the San Joaquin River and will be integrated into the CLSP levee open space areas, river areas, and adjacent linear community park. The preservation of the levee open space corridor and parallel linear community park forms and continues a strong framework of continuous open space within and beyond the CLSP-2 area, maintains an interconnected habitat system that allows for the connectivity of plant and wildlife communities, and support daily wildlife needs, while permitting limited public access to these areas. Public access along the potential levee top trail will permit scenic views from and access along the levee and to certain open space areas; this will protect sensitive habitats and wildlife from effects associated with human interaction.

Habitat Conservation Plan

The City of Lathrop adopted the San Joaquin Multi-Species Habitat Conservation and Open Space Plan (SJMSCP) on January 16, 2001, and signed the implementation agreement. The SJMSCP provides a process for plan participants to offset impacts to biological resources, conserve open space, maintain the agricultural

economy, and allow development within the County. With the adoption of the SJMSCP, U.S. Fish and Wildlife Service and the California Department of Fish and Game (now known as the Department of Fish & Wildlife) issued incidental take permits (ITPs). The ITPs authorized the incidental take of federally listed and state-listed threatened and endangered species and their habitats for a period of 50 years in exchange for participating project applicants paying mitigation fees. Fees are based on the amount and type of land converted from agricultural or open space uses to urban uses.

Ninety-seven species are covered by the SJMSCP, which is intended to provide comprehensive mitigation pursuant to local, state, and federal regulations for impacts on these species from SJMSCP-permitted activities.

Focused surveys for special-status species were not conducted for this project. Reconnaissance level surveys were conducted that included a habitat evaluation for all potentially occurring special-status species. Development of the CLSP-2 Amendment Plan Area is covered under the SJMSCP, with comprehensive habitat evaluations and focused surveys, when necessary, to be conducted for covered special-status species in accordance with the SJMSCP prior to ground disturbance.

Impacts to fishery and wetland resources that might occur in the CLSP-2 Amendment Plan Area that are not covered under the SJMSCP program must be permitted separately. Such permits may include authorization of dredge or fill of wetlands under Section 404 of the Clean Water Act and Incidental Take Authorization under Section 7 or Section 10 of the federal Endangered Species Act.

Historic and Cultural Resources

Based on a series of archaeological and historical resource surveys and records searches performed for the project, no archaeological sites have been identified within the CLSP-2 Amendment Plan

Area, nor would construction of the project affect any known prehistoric archaeological site.

The CLSP EIR provides mitigation and direction for further analysis of project related impacts on historical and cultural resources, as needed, and on how to proceed if any previously undiscovered or sub-surface archaeological artifacts or historical sites are discovered in the Plan Area. Refer to the CLSP EIR for additional information.

Chapter Five: Community Services and Facilities

Introduction

A wide array of public services and facilities are required to address the recreational, governmental, and emergency response needs of the CLSP-2 Amendment Plan Area. These services and facilities include parks; police, fire, and animal control services; civic facilities; and solid waste services. As the CLSP-2 Amendment Plan area develops, the City and other responsible agencies will review the plans to ensure that adequate public facilities and improvements are provided in a timely manner.

Parks and Recreation

Recreation is a key component in the lifestyle of people residing in any community environment. Recreation facilities and parks, in their active and passive forms, are an important asset contributing to the stability, attractiveness, and quality of life of a community. The City of Lathrop does not have adopted park/open space dedication or fee requirements for non-residential development. Such requirements are associated with residential uses which create the primary demand for, and benefit from proximity to, recreational facilities. The CLSP-2 Amendment designates an open space corridor along the San Joaquin River levee frontage. The open space provides opportunities to create an interconnected trail system from the CLSP-2 area to the Phase 1 Central Lathrop Specific Plan area, the West Lathrop Specific Plan area, and the South Lathrop Specific Plan area.

The general location of CLSP-2 Amendment parks, open space, and trails are included on Figure 5.1.

CLSP-2 Open Space

Open Space, Levee and River areas provide significant recreational, visual and aesthetic amenity to the CLSP-2. These areas offer a variety of functions and elements including passive recreation, scenic corridors, resource preservation, interpretive signage and informal recreation activities (i.e. picnic tables). In addition, the open space and levee corridor will improve the interface between urban and natural areas and define the City's edge.

The CLSP-2 Amendment open space and recreational areas consist of the levee and San Joaquin River that border the entire west side of the CLSP-2 Amendment Plan Area. The river provides several different recreational opportunities for the community, including fishing, bird watching, scenic views, camping and boating launch facilities at Dos Reis Regional Park. A regional gravel multi-use trail may be located within the open space adjacent to the levee if approved by the City of Lathrop and RD-17. The accessibility to the regional trail system, if approved, and the San Joaquin River will be direct and easy, with walking paths and bicycle trails extending to the north and south project boundaries.

CLSP-2 Open Space Interface

Linear Community Park, Open Space, Levee and Neighborhood Interface

The interface between the linear community park, open space and levee areas and adjacent development presents opportunities within the CLSP-2 Amendment Plan Area. Multiple edge treatments are required to maximize the opportunities therein. Access along the open space/levee frontage shall be provided as required by RD-17 and the City of Lathrop.

Where appropriate, the interface should be designed to allow residents to enjoy and appreciate the adjacent trails, park facilities, and open space areas, while providing a safe environment.

Dos Reis Regional Park Interface

The County operates and maintains Dos Reis Park, an existing park within the CLSP-2 Area. Dos Reis Regional Park provides for boat access to the San Joaquin River as well as camping and recreational opportunities for those from out of town. The Central Lathrop Park Master Plan design integrates with and thereby enhances the existing Dos Reis Regional Park. The interface of the Dos Reis Park with the community park will benefit both park systems and their users. Dos Reis Park will continue to be accessed via Dos Reis Road. No additional boat parking facilities will be provided as part of this Project. The interface between Dos Reis Park and the future adjacent limited industrial parcel shall include a masonry wall. See Chapter 7 Design Guidelines for more information.

Police and Animal Control Services

The City of Lathrop operates its own police department for police protection services. The City of Lathrop Police Department is located at 940 River Islands Parkway within Lathrop, approximately two and a half miles south of the Plan Area. The Lathrop Police Department provides services such as emergency law enforcement, routine patrol, traffic enforcement, a Crime Stoppers program, and a Crime Prevention program. The Police Department has 35 sworn officers and 12 non-sworn professional personnel.

New development in the CLSP-2 Amendment Plan Area will be required to pay the City's Capital Facility Development Fee to offset capital facility costs associated with police protection. In addition, development will be required to pay its pro rata share of start-up and ongoing costs.

The City of Lathrop will provide animal services to the CLSP-2 Plan Area. Animal Services Officers protect the health and safety of humans and animals and are responsible for enforcing local and state laws regarding animals and their humane treatment. Services include, but are not limited to, patrol, stray/abandoned animal pick-up, aggressive animal impounds, injured animal pick-up, humane investigations, nuisance investigations, wild animal complaints/impounds, licensing, dead animal impounds, adoption, and education.

New CLSP-2 Amendment development will be required to pay the City's Capital Facility Development Fee to offset capital facility costs associated with animal services. In addition, development will be required to pay its pro rata share of start-up and ongoing costs.

Fire and Emergency Services

The CLSP-2 Amendment Plan Area is within the service area of the Lathrop-Manteca Fire Protection District (LMFD). The District has multiple fire stations, three of which are located within the City of Lathrop. Station 34, located near the intersection of River Islands Parkways and Golden Valley Parkway, will initially be the first responder to serve the CLSP-2 area. In addition, Station 31, located on East J Street in Lathrop, and Station 35, on Somerston near River Islands, will both also provide service to the CLSP-2 area.

The LMFD maintains delivery standards for the provision of emergency services that adhere to the National Fire Protection Association's national standards and outlined in the LMFD Annual Report.

Development in the CLSP-2 Amendment Plan Area will pay applicable fire service fees and assessments required to fund its fair share of LMFD facilities and services. In addition, all development is required to conform to the California Fire Code, the City's Fire Sprinkler

Ordinance, fire flow standards, and other applicable requirements.

Solid Waste

Republic Services is the franchise waste hauler for residential and non-residential uses. The County of San Joaquin provides solid waste disposal facilities, including transfer stations and landfills. The City utilizes designated carts for the storage and collection of garbage, green (yard) waste, and paper, plastic, can, and bottle recycling. To reduce solid waste collection, builders, as mandated by AB 939, are required to implement and utilize construction debris recycling programs.

.

Chapter Six: Utilities and Drainage Infrastructure

Introduction

There is a very limited amount of infrastructure currently serving existing development within the CLSP-2 Amendment Plan Area. In order to accommodate the proposed development, numerous onsite and offsite infrastructure improvements will be needed. This chapter describes the major infrastructure improvements needed to serve the CLSP-2 Amendment Plan Area. Other infrastructure elements are discussed in other chapters of this Specific Plan as follows:

- Circulation and Transportation (roads, bike paths, and trails) - Chapter Three
- Emergency Services (fire and police) - Chapter Five

Potable Water

Supply

The City will supply potable water to the CLSP-2 Amendment Plan Area. The CLSP-2 Amendment Developers will fund the provision of water service. The City will provide potable groundwater from the City's existing well field and potable surface water from Phase 1 and/or the Phase 2 expansion of the South County Surface Water Supply Program (SCSWSP) by the South San Joaquin Irrigation District (SSJID).

The City has prepared a citywide 2020 Urban Water Management Plan (UWMP). The Plan reflects the City's existing and future water

demands (including those of the Plan Area) compared to available water supplies to ensure that adequate water is, or will be, available to accommodate the CLSP-2 Amendment. The studies conclude that with the combined groundwater and SCSWSP surface water sources adequate water supplies would be available to serve the CLSP-2 Amendment Plan Area.

Table 6.1 identifies Plan Area water demand for the CLSP-2 Amendment. The availability of potable water is a primary factor regulating the level of development in the CLSP-2 Amendment Plan Area.

In addition to the potable supply, the CLSP-2 Amendment makes maximum use of recycled water (treated wastewater) for the irrigation of public rights of way and open space. Further, the potential exists for the irrigation of private open space areas and other landscaping with the use of recycled water to the extent allowed by the City of Lathrop's Waste Discharge Permit issued by the RWQCB.

Treatment

Treatment of water supply occurs, as necessary, to meet federal, state, and local standards. The SCSWSP surface water supply is treated at a centralized facility located outside the City of Lathrop, with Lathrop's groundwater treated at the wellhead. As a result, there is not a need for potable water treatment facilities within the Plan Area.

Table 6.1: Estimated Water Demand

Designation	Land Use	Area (acres)	Demand Factor (gpd/ac)	Demand (gpd)
LI-CL	Limited Industrial	618.2	926	572,453
OS-CL	Open Space	29.3	0	
P-CL	Park	11.2	0	
	Major Road Right-of-Way	65.3	0	
	Total	724.0		572,453

Storage and Pressure

Potable water storage and distribution will be provided to the CLSP-2 Amendment Plan Area by extending the City’s existing pipe network into the CLSP-2 Amendment Plan Area generally consistent with the City Master Utility Plan. Project proponents in the CLSP-2 Amendment will construct and/or contribute fees toward its proportional share of water storage as specified in the City Master Utility Plan.

The City’s 2020 Urban Water Management Plan identifies three components of water storage including emergency, fire and equalization. Emergency storage is intended to provide water supply in the event there is a problem with the typical daily supply. Emergency supply can consist of “emergency only” wells and/or tank storage. Fire storage is intended to provide water supply to fight fires and must be accommodated by tank storage. Equalization storage is intended to help dampen out the impact of daily fluctuations in demand and must be accommodated by tank storage. The timing and size of the water storage tank and booster pump will be determined with future planning efforts such as during tentative map and/or site plan review processing. The water tank could potentially be located anywhere within the CLSP-1 or CLSP-2 Amendment Plan Area. A 1.6-million-gallon water tank and booster pump station was constructed within the CLSP Phase 1

area, and this site can accommodate a second tank to serve development of the CLSP-2 Amendment. Booster pump modifications may be required. The exact location of the water tank will be determined when more detailed development proposals are submitted. The first project to develop within the CLSP-2 Amendment Plan Area will be responsible for preparing the water study to determine the size, location, and construction timing of the water tank.

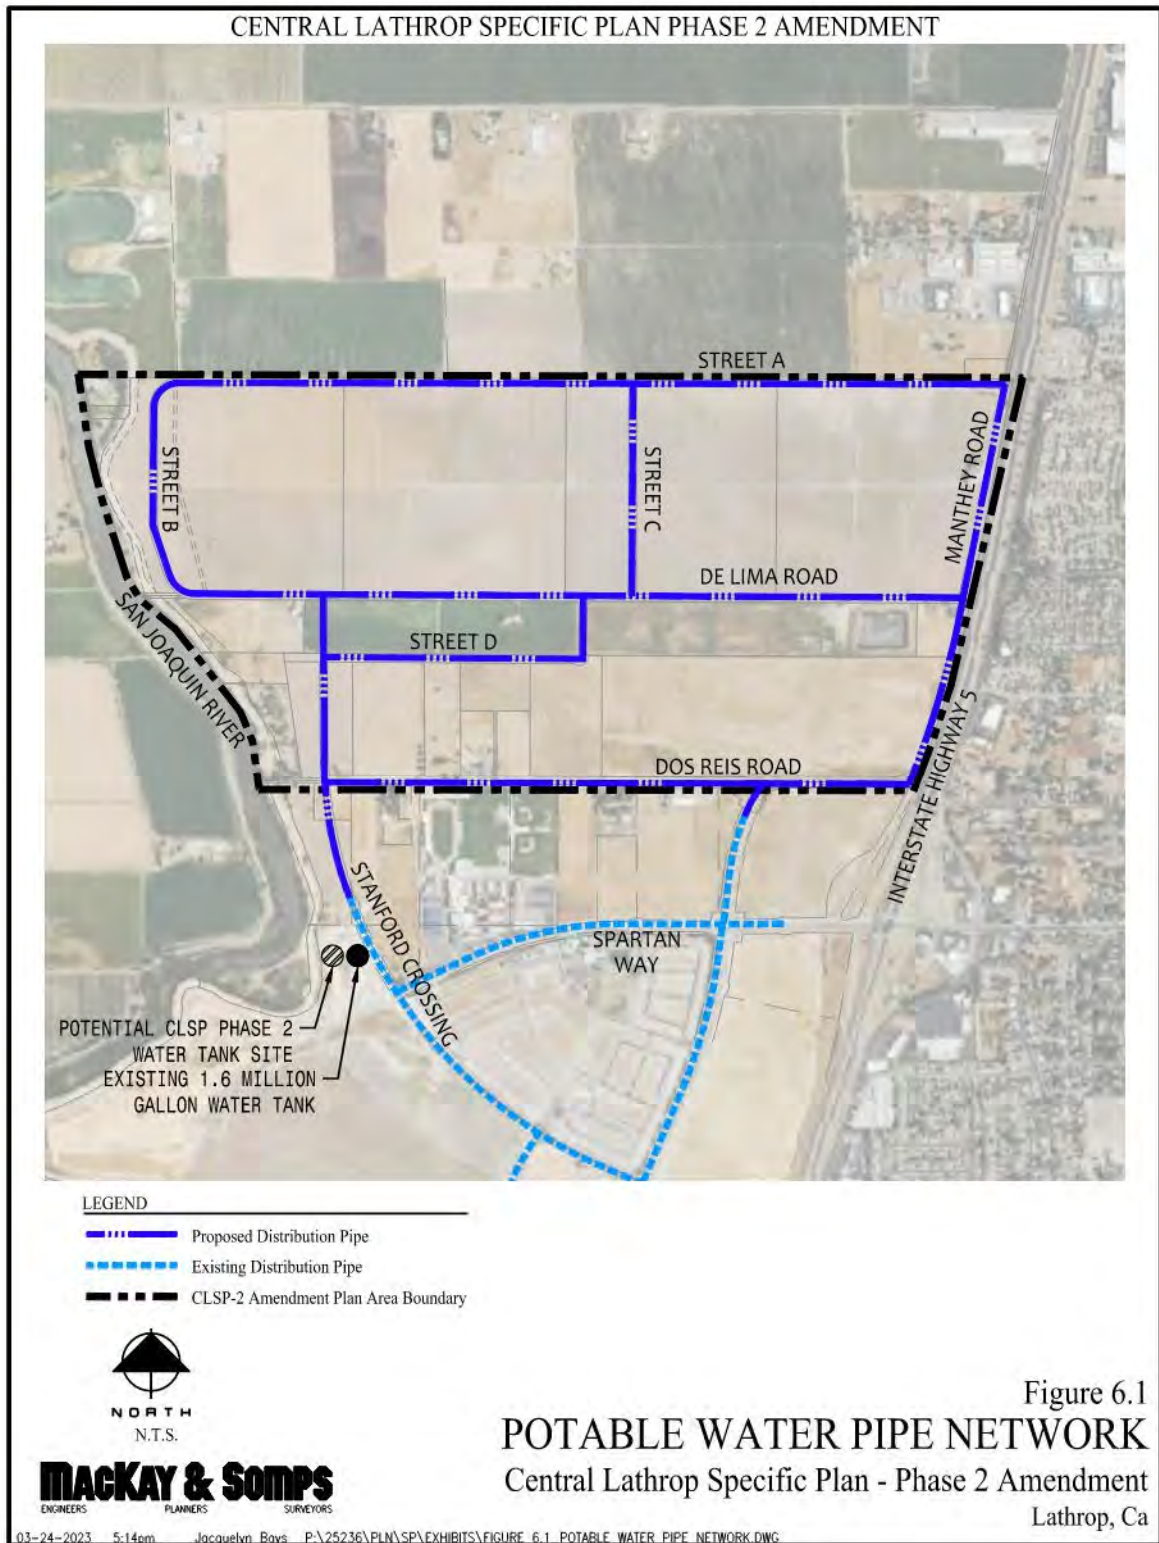

Potable Water Pipe Network

The City currently serves properties along Dos Reis, De Lima and a portion of Manthey Roads with potable water via old pipes. It is possible that some, if not all, of these existing pipes may need to be replaced to accommodate pipe and street improvements associated with development of the CLSP-2 Amendment.

Each of the major roadways in the Plan Area includes a water main as shown on Figure 6.1. These proposed mains form a looped infrastructure water system into which individual industrial and commercial parcels in the CLSP-2 Amendment Plan Area and will subsequently be connected. It is estimated that the water mains will be 12” diameter pipes. The exact size of the mains will be determined through a water model analysis that considers the rest of the City’s water system and pressures necessary to meet fire flow

requirements. The water model will be prepared with future planning efforts such as during tentative map and/or site plan review processing.

Figure 6.1- Potable Water Pipe Network

Wastewater

When the City adopted the CLSP in 2004, a public sewer system did not exist in the CLSP Plan Area. Existing rural residences and other developments disposed of their wastewater through private septic systems and/or leech fields. However, a public sewer system was installed with the CLSP Phase 1 development that was oversized for the CLSP Phase 2 Plan Area. New pipes and a new pump station will be required within the CLSP-2 Amendment Plan Area that will connect to the existing infrastructure within Phase 1. CLSP-2 Amendment Developers will fund or construct the new infrastructure through the payment of development impact fees.

Estimated Wastewater Generation

The estimated wastewater generation from the CLSP-2 Amendment Plan Area is approximately 219,461 gallons per day average dry weather flow (ADWF). The City of Lathrop utilizes two different demand factors for wastewater generation. Dry uses can assume a demand factor of 172 gpd/ac and other uses can assume a demand factor of 355 gpd/ac. If the dry use demand is used for a particular development a deed restriction would need to be recorded. The more conservative 355 gpd/ac was used to generate wastewater demands in order to size the infrastructure Table 6.2 summarizing the estimated wastewater generation.

Collection System

The CLSP-2 Amendment would rely on a gravity wastewater collection infrastructure system as shown on Figure 6.2. Due to the flat topography of the area, a lift or pump station will be needed to convey wastewater to the existing Central Lathrop Specific Plan Phase 1 pump station. From that pump station, force main systems convey wastewater to the treatment plant.

Once cumulative wastewater generation from Central Lathrop Specific Plan Phases 1 & 2 exceeds 400,000 gpd, offsite force main improvements are required to increase the overall capacity of the system. To achieve the increased capacity for the wastewater system within the CLSP Plan Area the following improvements are needed:

- Adjust the pump flow control restrictions as required at the existing Central Lathrop Specific Plan Phase 1 pump station.
- Disconnect the Central Lathrop Specific Plan to Mossdale intertie and construct a manifold connecting the Central Lathrop Specific Plan 14" and 18" force mains to the River Islands 12" and 18" force mains near the end of Harlan Road at the I-5 crossing. Construct a new 20" force main from the Central Lathrop Specific Plan/River Islands manifold to the Consolidated Treatment Facility (CTF) manifold.

The offsite wastewater improvements are shown in Figure 6.3.

Treatment

Wastewater generated by development in the CLSP-2 Amendment Plan Area will be treated to meet Federal, State, and City standards before it is disposed of. As shown on Figure 6.2, wastewater will be treated by existing capacity and future expansions to the Consolidated Treatment Facility (CTF).

The City has a river discharge permit that will allow for the disposal of recycled water to the San Joaquin River. The City constructed the outfall in the Fall of 2022.

Table 6.2: Estimated Sewer Demand

Designation	Land Use	Area (acres)	Demand Factor (gpd/ac)	Demand (gpd)
LI-CL	Limited Industrial	618.2	355	219,461
OS-CL	Open Space	29.3	0	
P-CL	Park	11.2	0	
	Major Road Right-of-Way	65.3	0	
	Total	724.0		219,461

Figure 6.2- Wastewater Network

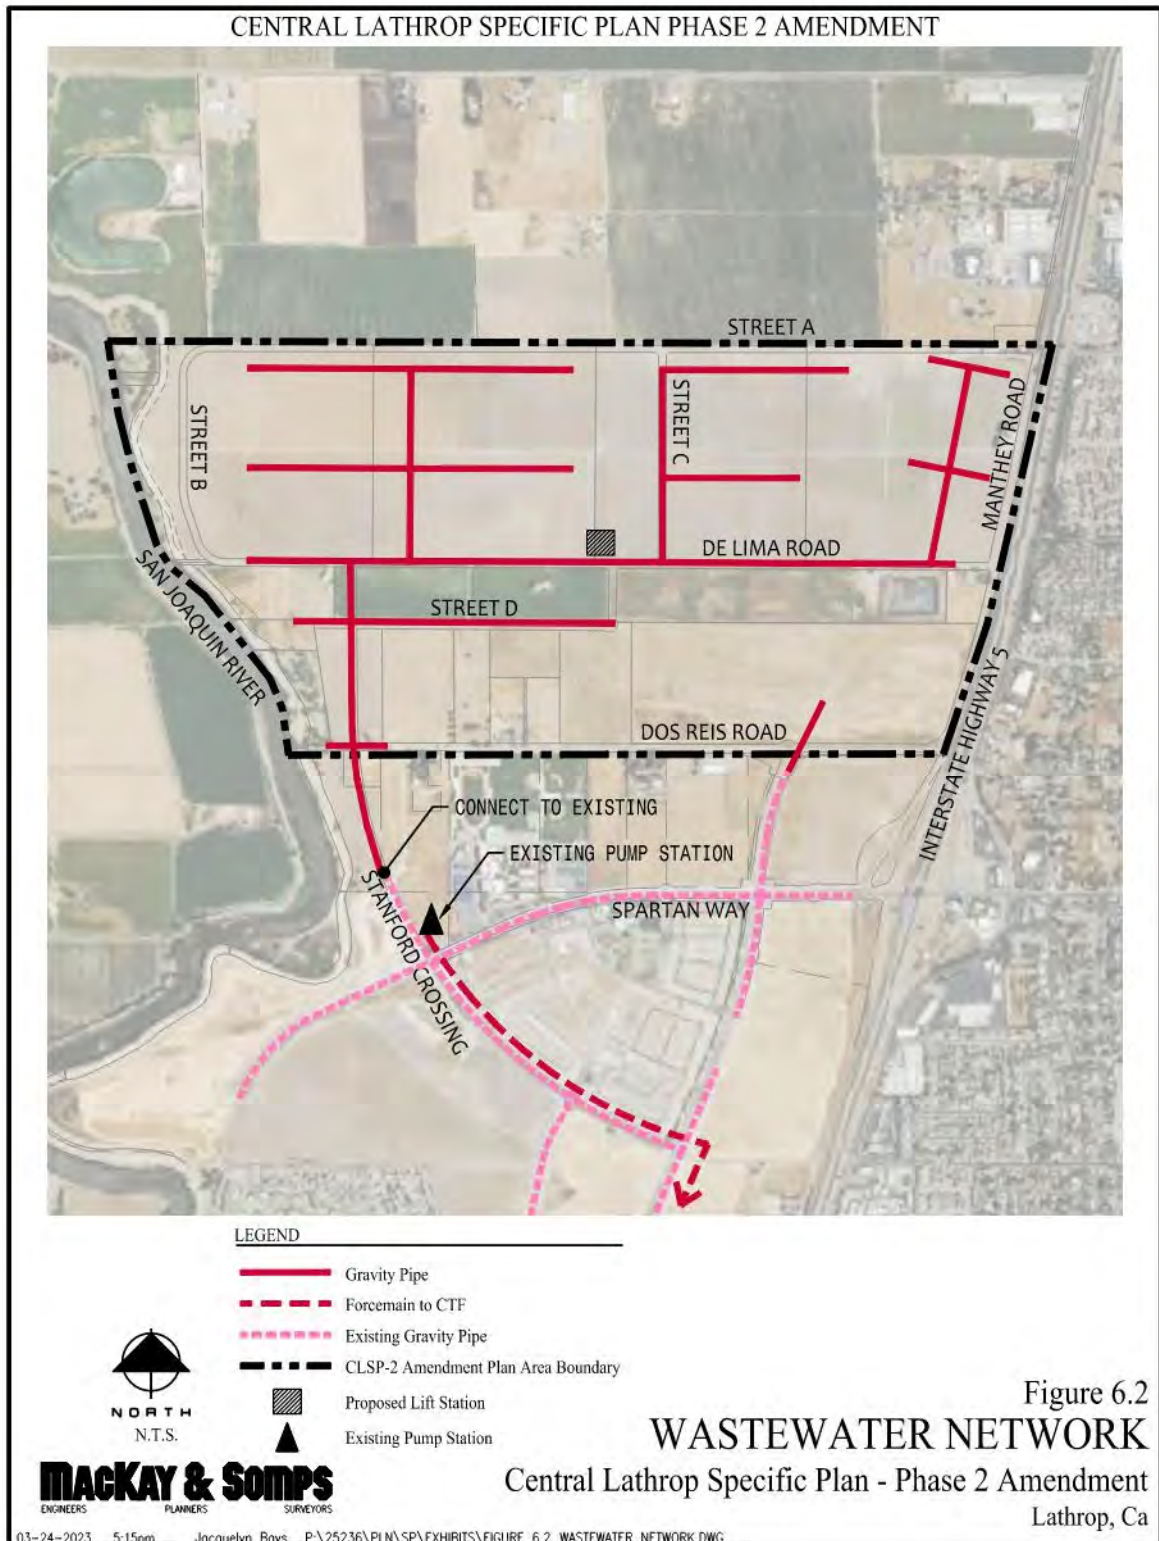

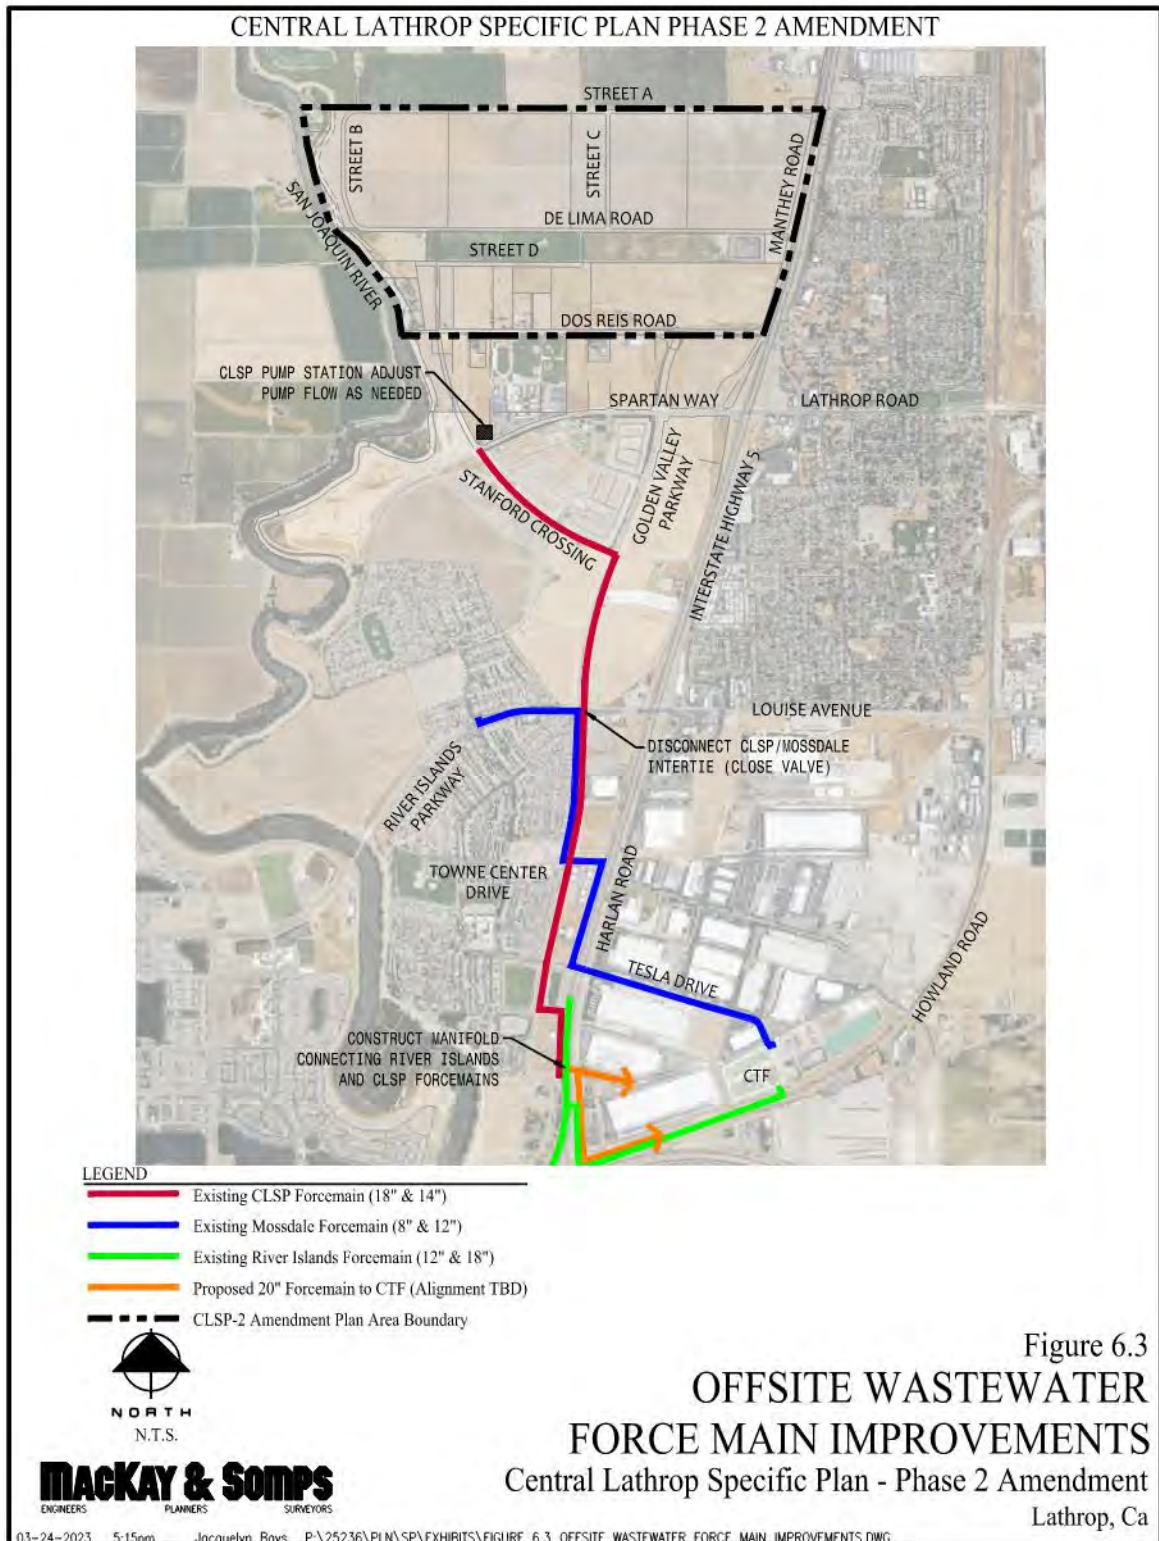

Figure 6.3- Offsite Wastewater Force Main Improvements

Recycled Water

The CLSP-2 Amendment will maximize reuse opportunities for recycled water. The term “recycled water” refers to wastewater that has been treated and disinfected to tertiary levels. Water treated to this level has been determined by governmental regulations to be acceptable for human contact without cause for concern and is commonly used for irrigation. The use of recycled water is regulated by the Regional Water Quality Control Board (RWQCB) and the Department of Health Services, which apply stringent water quality, treatment and disinfection standards.

The use of recycled water for irrigation serves to conserve potable water for other uses. In addition, in the event the potable water supply is limited at any time, such as a “dry year” situation, the use of recycled water ensures a supply for landscaped areas and reduces the likelihood that potable water would be needed for this purpose.

The CLSP-2 Amendment proposes to make recycled water available for public irrigation uses. This includes irrigation of landscaped areas within street rights-of-way and open space. In addition, there may be potential for the use of recycled water for private irrigation uses as well,

such as common open space areas and landscaping around buildings.

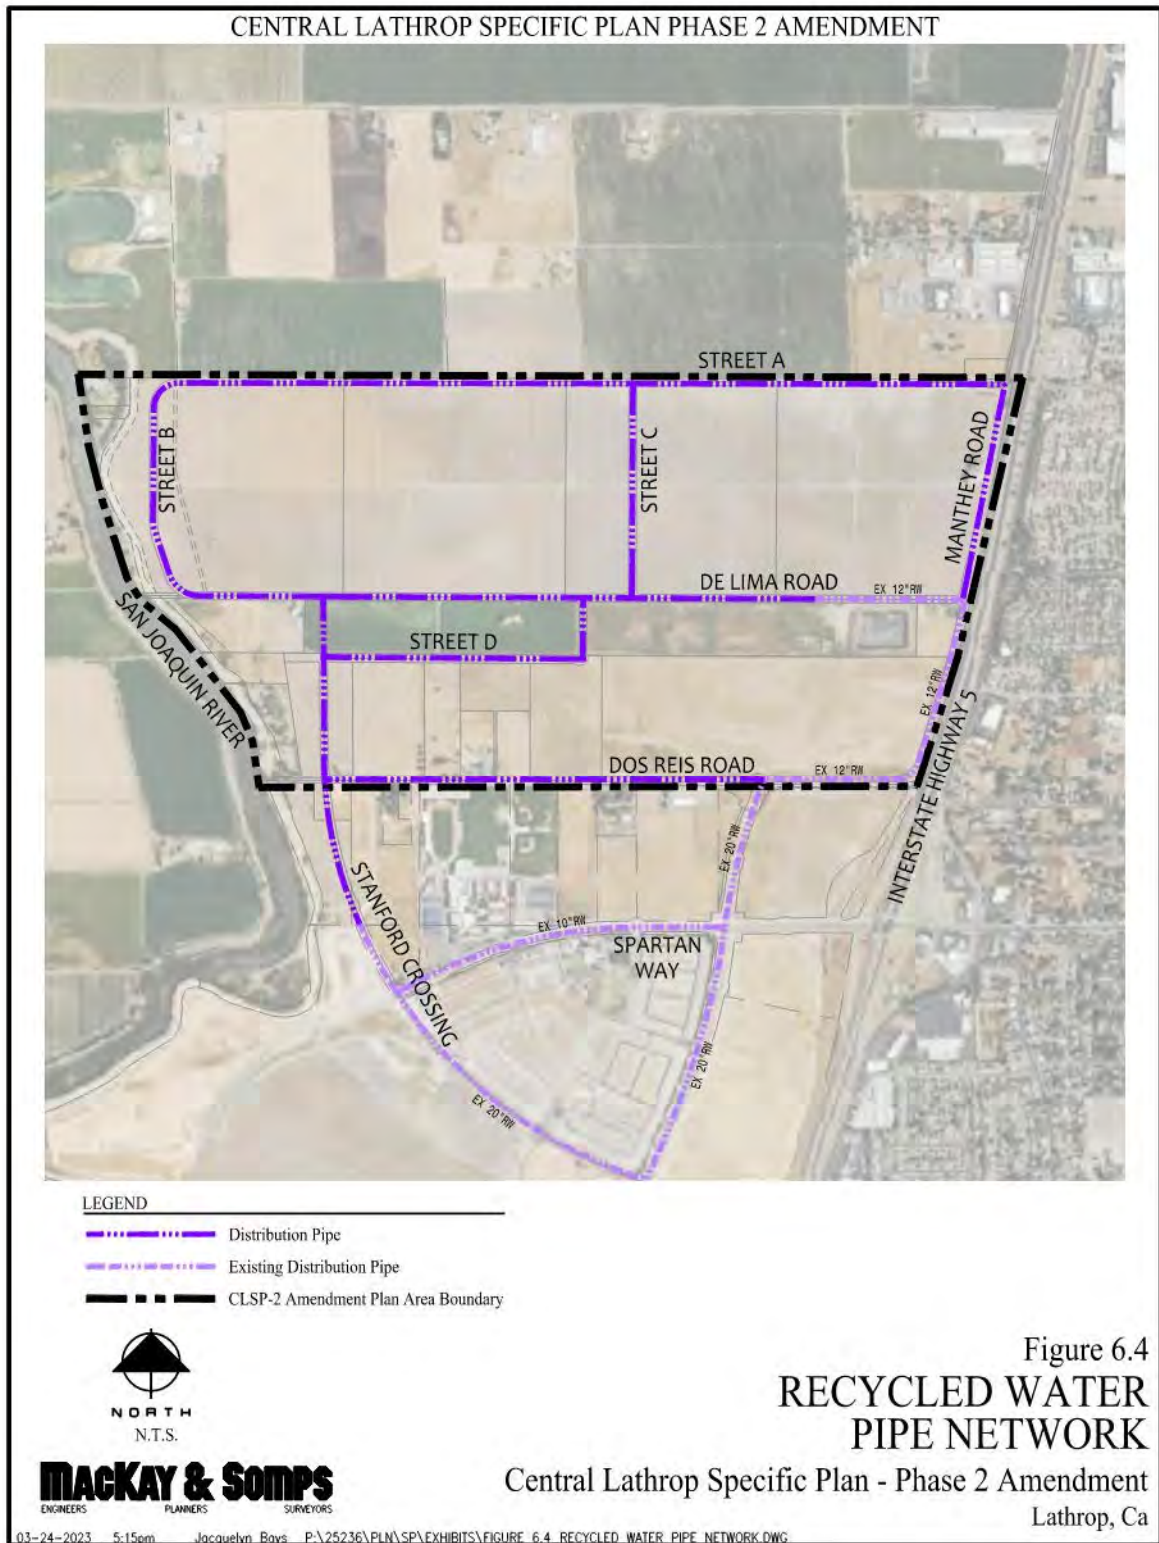

Criteria for management of the recycled water system and public education about it will be established in future reports (or other documents) and will be subject to City approval.

Recycled Water Pipe Network

An existing recycled water pipeline is located in Golden Valley Parkway and Stanford Crossing and will be the connection point for the Plan Area. Each of the major roadways in the Plan Area includes a recycled water main as shown in Figure 6.4. These proposed mains form a looped infrastructure recycled water system into which public and potentially private landscaped areas can be connected.

Due to the limited demand for recycled water within the Plan Area, the City Engineer can determine the need for recycled water improvements with future development applications. The pipe network illustrated on Figure 6.4 is conceptual and subject to final review by the City Engineer when public improvement plan are prepared.

Figure 6.4- Recycled Water Pipe Network

Flood Protection and Storm Water Quality

Background

An existing levee along the San Joaquin River protects the Plan Area from flooding RD-17 operates and maintains the levee. The Federal Emergency Management Agency (FEMA) has categorized the Plan Area as being in Zone X as shown on Flood Insurance Rate Map (FIRM) panel numbers 06077C0605F and 06077C0610F. The Zone X definition relevant to the Plan Area is “areas protected by levees from 1% annual chance flood”.

The RD-17 levee system has been undergoing seepage berm and/or other improvement repair/upgrade projects to increase the resistance to under-seepage and through-seepage in order maintain compliance with applicable Federal, State, and local standards. A minimum 120 foot “no-build” buffer along the levee as measured from the levee toe is provided within the CLSP-2 Amendment Plan Area to allow adequate space for future improvements if/when needed.

RD-17 has been working with the Department of Water Resources (DWR) and the Central Valley Flood Protection Board (CVFPB) to evaluate options for providing 200-year protection for the Mossdale Tract including the CLSP-2 Amendment Plan Area. The 120’ “no-build” buffer within the CLSP-2 Amendment Plan Area provides sufficient area to accommodate any 100-year improvements and any additional incremental improvements to provide 200-year protection in the future in conjunction with the Mossdale Tract 200-year flood protection improvements to meet the urban level of flood protection criteria.

Using design standards developed in cooperation with the City, the CLSP drainage improvement program will provide for efficient discharge of runoff from a 10-year storm event while also protecting the site from flooding during a 100-year storm event. It is also desirable that a high

degree of design flexibility be incorporated into the drainage program. This flexibility will allow sufficient latitude for each new development within the CLSP-2 Amendment Plan Area to design an internal system that meets its site-specific needs, so long as the design is consistent with the overall CLSP-2 Amendment Plan Area Drainage Plan.

Existing Conditions and Constraints

The CLSP area is part of a larger watershed known as “the Northern Area” that includes areas both east and west of Interstate 5.

The CLSP-2 Amendment Plan Area is about 20 feet lower than the top of the adjacent San Joaquin River levee. Therefore, runoff must be pumped over/through the levee. To avoid adverse impact to the levees near the CLSP Plan Area, peak discharge is limited to 30% of the 100-year flow rate from the watershed as stated in the 2004 CLSP and CLSP EIR. Therefore, the CLSP-2 Amendment incorporates on-site detention to store excess runoff during periods of peak storm activity.

Two storm drain outfalls to the San Joaquin River exist within the CLSP Plan Area. One outfall is located within the Phase 1 area and the other is located within the Phase 2 area. The outfalls are sized to accommodate the development of the CLSP-2 Amendment Plan Area.

An existing storm drain force main is located within Dos Reis Road and connects existing development east of Interstate-5 to the existing outfall located at the end of Dos Reis Road.

When the City approved the 2004 CLSP, runoff from the CLSP Plan Area was collected in a system of shallow agricultural ditches, roadside ditches, and percolation basins with some small private agricultural pumps that discharged water to the San Joaquin River. However, public storm drain infrastructure is now available that was built with Phase 1 of the CLSP. Existing pipes

are located at the northern end of Golden Valley Parkway just south of Dos Reis Road and at the northern end of Stanford Crossing.

Shallow groundwater exists throughout the CLSP-2 Amendment Plan Area and is influenced by both the water level in the river and sub-surface flow from areas of higher elevation to the east, as well as local irrigation practices. Even though the groundwater level may decline with a reduction in farming activities, it is expected that this high ground water condition will generally persist after development, impacting both construction and the future operation of the storm drain system. Infiltration into the storm pipes through joints and underground structures can result in excessive pumping demands throughout the life of the project. This impact will be reduced by proper installation of pipes having rubber gasket sealed joints.

High groundwater levels can also impact the effectiveness of detention basins. To the extent that groundwater enters the basins, the storage available for the runoff is diminished. There are no detention basins proposed, however if a detention basin is proposed in-lieu of underground storage, the bottom of the basin will be designed to maintain a minimum of two feet of separation from groundwater or other design measures will be implemented such as impervious liners with sub drain systems.

The Storm Collection System

Runoff from the CLSP-2 Amendment Plan Area is designed to discharge to the river through an existing outfall located near the southwest corner of the CLSP-2 Amendment Plan Area at the end of Dos Reis Road and the existing outfall within the Phase 1 area. The existing outfalls are regional facilities. As shown on Figure 6.7, the CLSP-2 Amendment Plan Area will consist of a system having the following three integrated components.

- Gravity lines that collect and deliver surface runoff;

- “Watershed” detention facilities that hold the runoff; and
- A pump station and force main that conveys water to an existing San Joaquin River outfall structure.

The CLSP-2 Amendment Plan Area consists of two major drainage sheds with underground storage pipes to reduce the peak discharge from the Plan Area to the San Joaquin River. Watershed 4 is a part of both the Central Lathrop Specific Plan Phase 1 and this Phase 2 Specific Plan Amendment. The CLSP-2 Amendment proposes to modify the boundary of the existing Watershed 4 to better align with existing property boundaries. See Figure 6.5 for the existing watersheds and Figure 6.6 for the proposed watersheds.

The modification to the watershed 4 boundary will require additional storage which can be accomplished with large diameter storm drain pipes.

In addition to the added storage, a new 39cfs pump will need to be added to the existing Phase 1 storm drain pump station. The pump station is already set up to accept the additional pump so physical pump station modifications are not expected.

The remainder of the CLSP-2 Amendment Plan Area falls within Watershed 3. Large diameter storm drain pipes will be utilized to provide the required underground storage. The underground pipe storage system location will be dispersed throughout the CLSP-2 Amendment Plan Area, with individual developments responsible for a per acre proportional share of the overall storage requirement. A new pump station and force main will be constructed that will connect to an existing outfall structure. The existing outfall structure will need to be retrofit to meet current design standards. The existing headwall is expected to remain in-place, but the existing pipes connecting to the headwall will need to

removed and replaced near to the top of the levees to increase the elevation of the pipes. New valves will also need to be added to the pipes as required by the current design standards. The Storm drain-system illustrated in Figure 6.7 is conceptual and subject to change based on future planning and engineering efforts.

The proposed stormwater collection system functions by discharging all runoff directly into the river up to the point where the runoff rate exceeds the capacity of the pump station. When the rate of runoff exceeds the pump station capacity, water “backs up” into the detention pipes until the runoff rate declines and once again equals the capacity of the pump station. The water level in the storage pipes then decreases, emptying completely.

Based on a preliminary design analysis the approximate volume of the underground storage and maximum allowable discharge rates are summarized in Table 6.3. Storage is based on the maximum discharge rate shown.

Table 6.3: Watershed Detention Facilities and Pump Station Sizes

Watershed	Maximum Pumping Rate	Total Storage
	CFS	Acre-feet
3	176.7	1.53
4	78.6	17.36
Total	255.3	18.89

Flood Protection

A key element of the CLSP-2 Amendment Plan Area storm drain system is its ability to handle the runoff that occurs during a high intensity storm. The drainage system provides multiple layers of protection based on the severity of storm events:

- 10-year Event - The underground system is designed with capacity to accommodate the drainage flows anticipated to occur as a result of a 10-year storm event.

- 10 to 100-year Event - When the capacity of the underground system is exceeded during an intense storm event (in excess of a ten-year event), water flows will be detained in underground storage pipes, designed for the 100-year storm event and distributed throughout the CLSP-2 Amendment Plan Area. This design method keeps the flow depth underground, within acceptable limits (i.e., one foot below floor elevations) and the threat of flooding posed to private property is minimized. An alternative design could be to allow the streets to flood and provide overland release by means of a descending gradient directing surface flow towards a proposed detention basin. This type of design would require flow in the streets.
- 10 to 100-year Event with Pump Discharge limited – The CLSP-2 Amendment Plan Area storm drain system is also designed to provide flood protection in circumstances requiring a reduction in flow rates of the system pumps that discharge into the San Joaquin River. The Central Valley Flood Protection Board and the City may limit river discharge to pre-development levels whenever the river stage exceeds certain flood elevations. When pump discharge is limited, the CLSP-2 Amendment Plan Area must be able to accommodate the volume of a 100-year, 24-hour storm without flooding buildings. Under these extreme circumstances, the volume of water that must be stored in the Plan Area may exceed the capacity of the detention facilities and will be held in the streets, parking lots and/or other areas.

The CLSP-2 Amendment Plan Area grading concept preserves the elevation of the streets within the watershed at approximately the same elevation as existing conditions. During a rare condition, when the San Joaquin River is high and the stormwater pumps must be reduced, the underground storage allows runoff to be spread

throughout the shed avoiding excessive depth of inundation in any one area.

The 2022 Lathrop General Plan amendment changing residential uses to Limited Industrial uses in the CLSP-2 Amendment Plan Area is consistent with the floodplain management strategy included in the San Joaquin Area Flood Control Agency (SJAFC) 200-year Fix-in-Place levee improvement project for the Mossdale Tract.

Stormwater Quality

The CLSP- 2 Amendment Plan Area drainage system will include features designed to ensure that the stormwater quality meets current water quality standards in conformance with Phase II MS4 National Pollutant Discharge Elimination System (NPDES) regulations. Because the site discharges into the San Joaquin River, runoff quality must also meet standards of the regulatory agencies.

Runoff will be treated to the “maximum extent practicable” by implementing appropriate source and treatment control Best Management Practices (BMPs). These practices may include, but are not limited to:

- Bioretention
- Infiltration basin
- Underground water quality vaults (i.e., CDS vaults)
- Disconnected roof leaders (i.e., roof leaders connect to “bubble-up” inlets in landscaped areas away from building foundations rather than to the storm drain system)
- Swales
- Downspout and/or inlet filters
- Porous Pavements

- Inlet stenciling
- Street sweeping

Stormwater treatment must meet the criteria of the Multi-Agency Post Construction Stormwater Standards Manual. Additional requirements may be imposed on some industrial and commercial uses.

It is anticipated that new public roads within the CLSP-2 Amendment Plan Area will be treated with roadside bioretention areas and stormwater quality for the individual developments will be treated onsite in bioretention areas, prior to discharging into the public storm drain system. Per Section 1.5 of the Multi-Agency Post Construction Stormwater Standards Manual public roadway replacements and widenings allow for reductions and/or exceptions in storm water quality treatment requirements.

The storm water runoff on Dos Reis Road between Stanford Crossing and Golden Valley Parkway is exempt from storm water quality requirements per Section 1.5 of the Multi-Agency Post Construction Stormwater Standards Manual because the addition of traffic lanes results in an alteration of 50% or less of the existing Dos Reis Road impervious area in this section of roadway and the proposed 8’ trail and bicycle lane are graded to runoff to adjacent vegetated areas.

Similarly, the storm water runoff from Manthey Road is exempt from storm water quality requirements per Section 1.5 of the Multi-Agency Post Construction Stormwater Standards Manual because the addition of traffic lanes results in an alteration of 50% or less of the existing Manthey Road impervious area in this section of improvement and the proposed 8’ trail and bicycle lane are graded to runoff to adjacent vegetated areas.

Section 1.5 of the Multi-Agency Post Construction Stormwater Standards Manual also allows for the reduction of storm water treatment area required to treat runoff from Dos Reis Road

between Golden Valley Parkway and Manthey Road because the addition of traffic lanes results in an alteration of 50% or less of the existing Dos Reis Road impervious area in this section of roadway and the proposed 8' trail and bicycle lane are graded to runoff to adjacent vegetated areas.

It is likely other street replacements/widenings in the CLSP-2 Amendment Area will fall into these reductions/exceptions categories in the future reducing the required treatment areas for public roadways as directed by the City.

Figure 6.5- Existing Watersheds

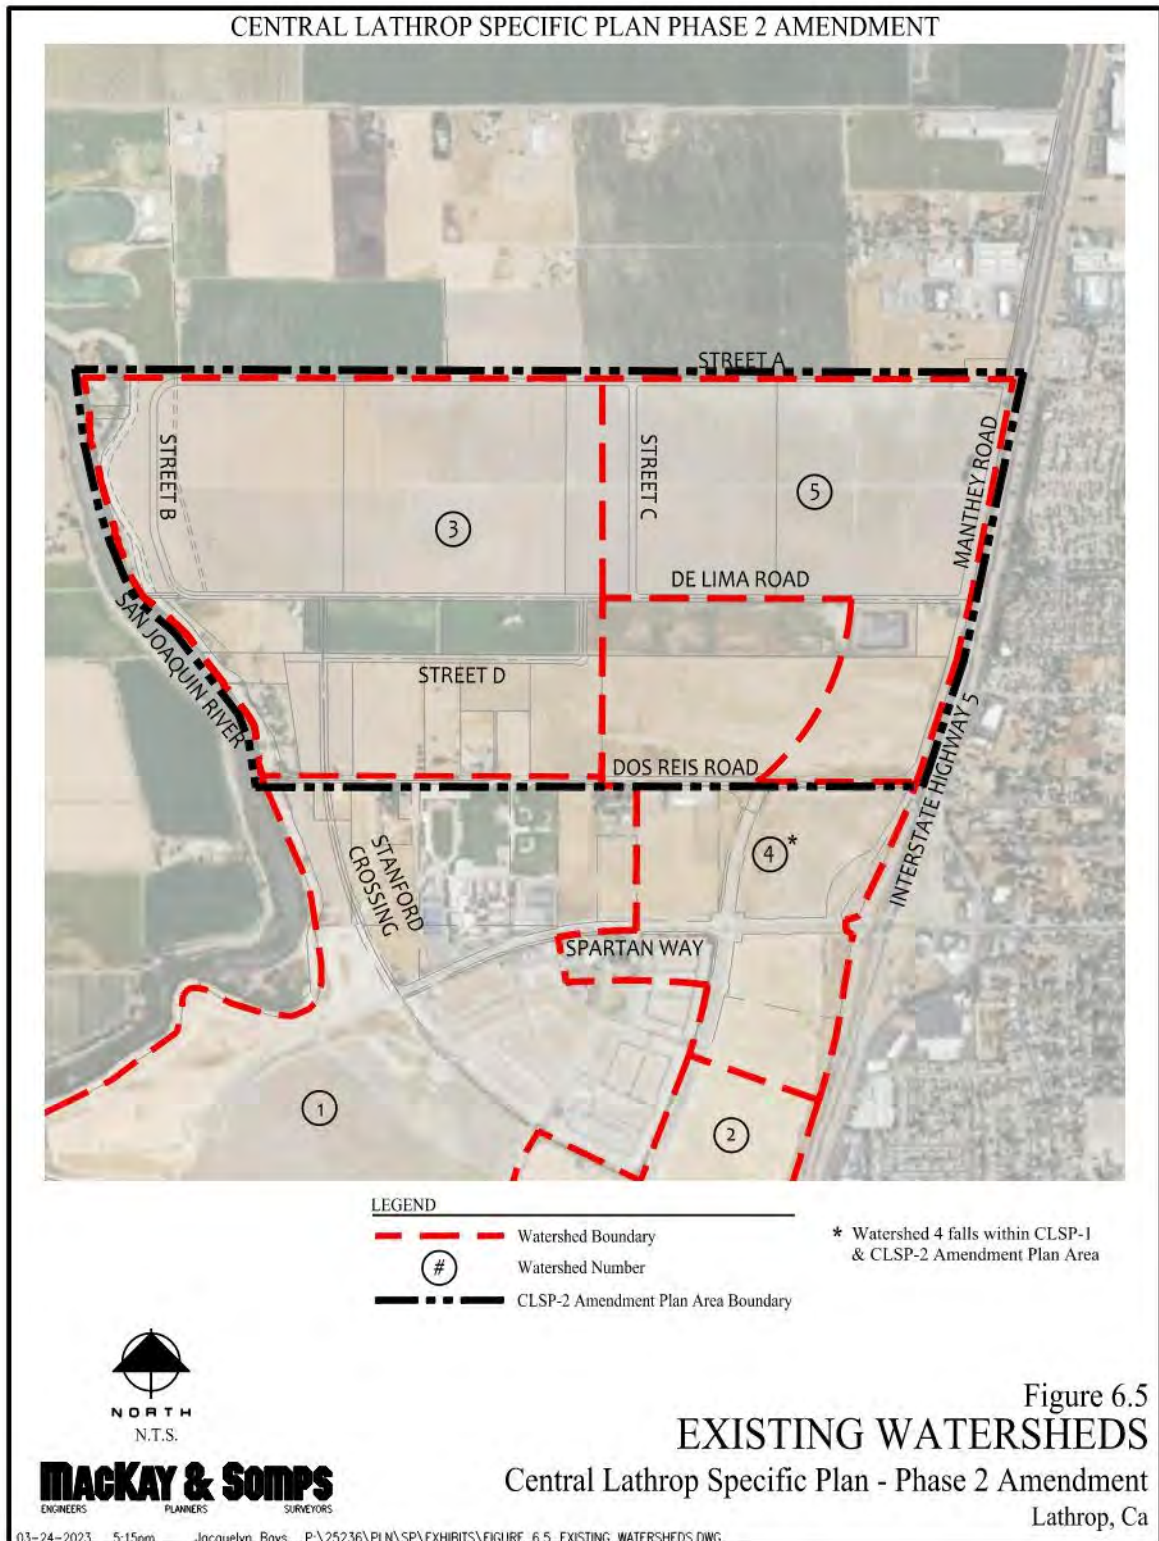

Figure 6.6- Proposed Watersheds

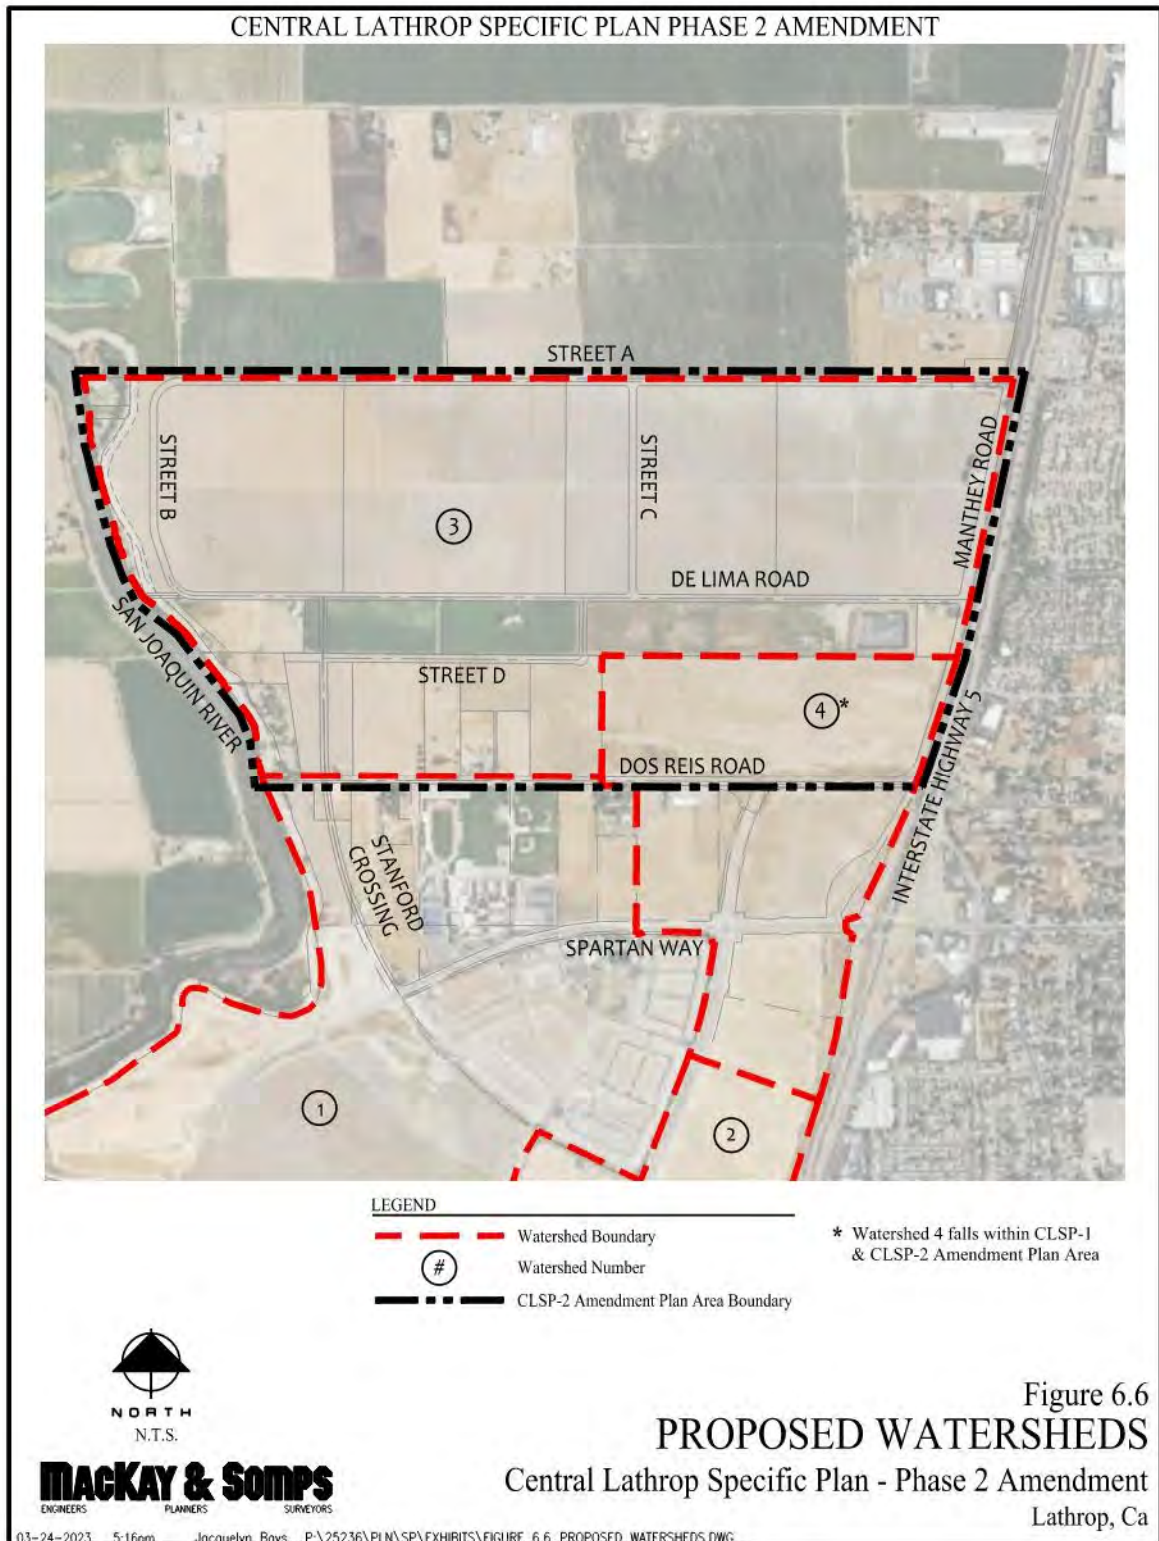

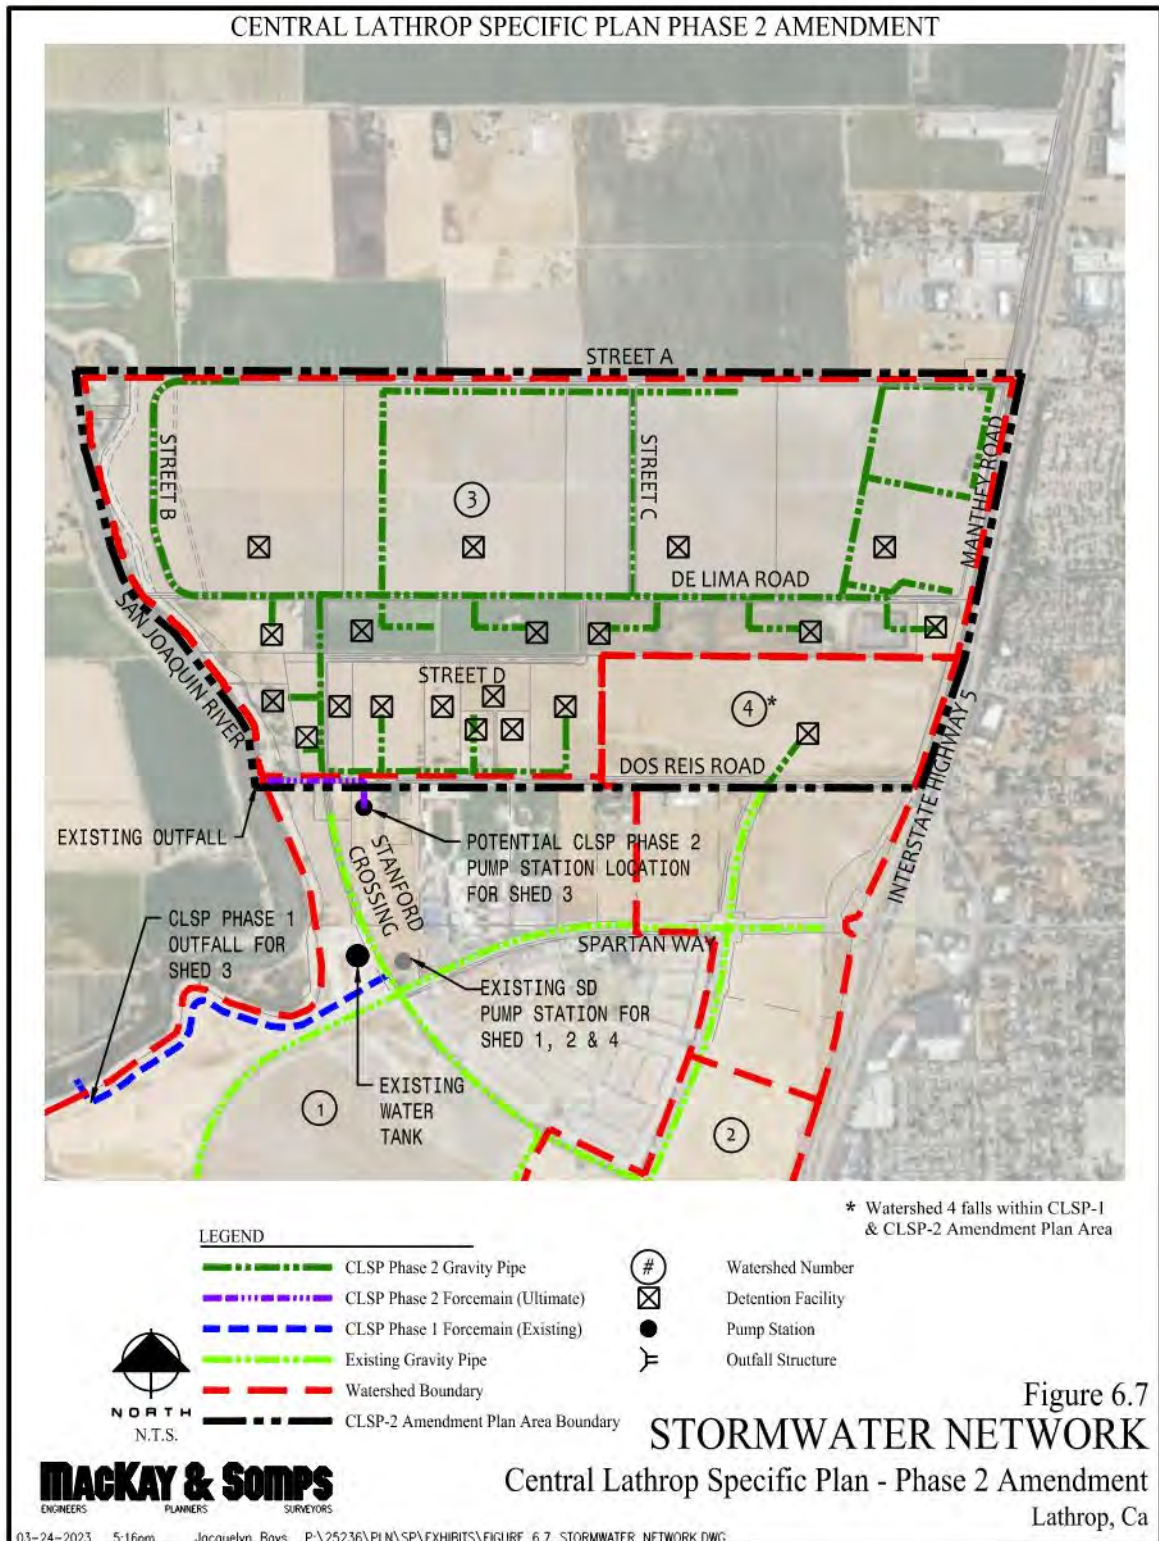

Figure 6.7- Stormwater Network

Public Utility Easements and Utility Corridors

For a discussion regarding the location and use of public utility easements and utility corridors, please refer to Chapter Three: Circulation and Transportation.

Energy and Telecommunications

Power

Electrical service will be provided to the CLSP-2 Amendment Plan Area by Pacific Gas and Electric (PG&E). Existing high voltage power lines, within PG&E power line easements, traverse through a portion of the CLSP-2 Amendment Plan Area. Existing power lines within the CLSP-2 Amendment Plan Area 1 are shown on Figure 6.8.

It is anticipated that all existing overhead power lines 34.5Kv and under will be relocated and/or be placed underground as the CLSP-2 Amendment Plan Area develops. New power lines constructed to serve the Plan Area, as well as all other utilities, will be installed underground in a typical joint trench.

PG&E will extend electricity service in a timely manner to serve each development as needed during the phased implementation of the CLSP-2 Amendment.

Gas

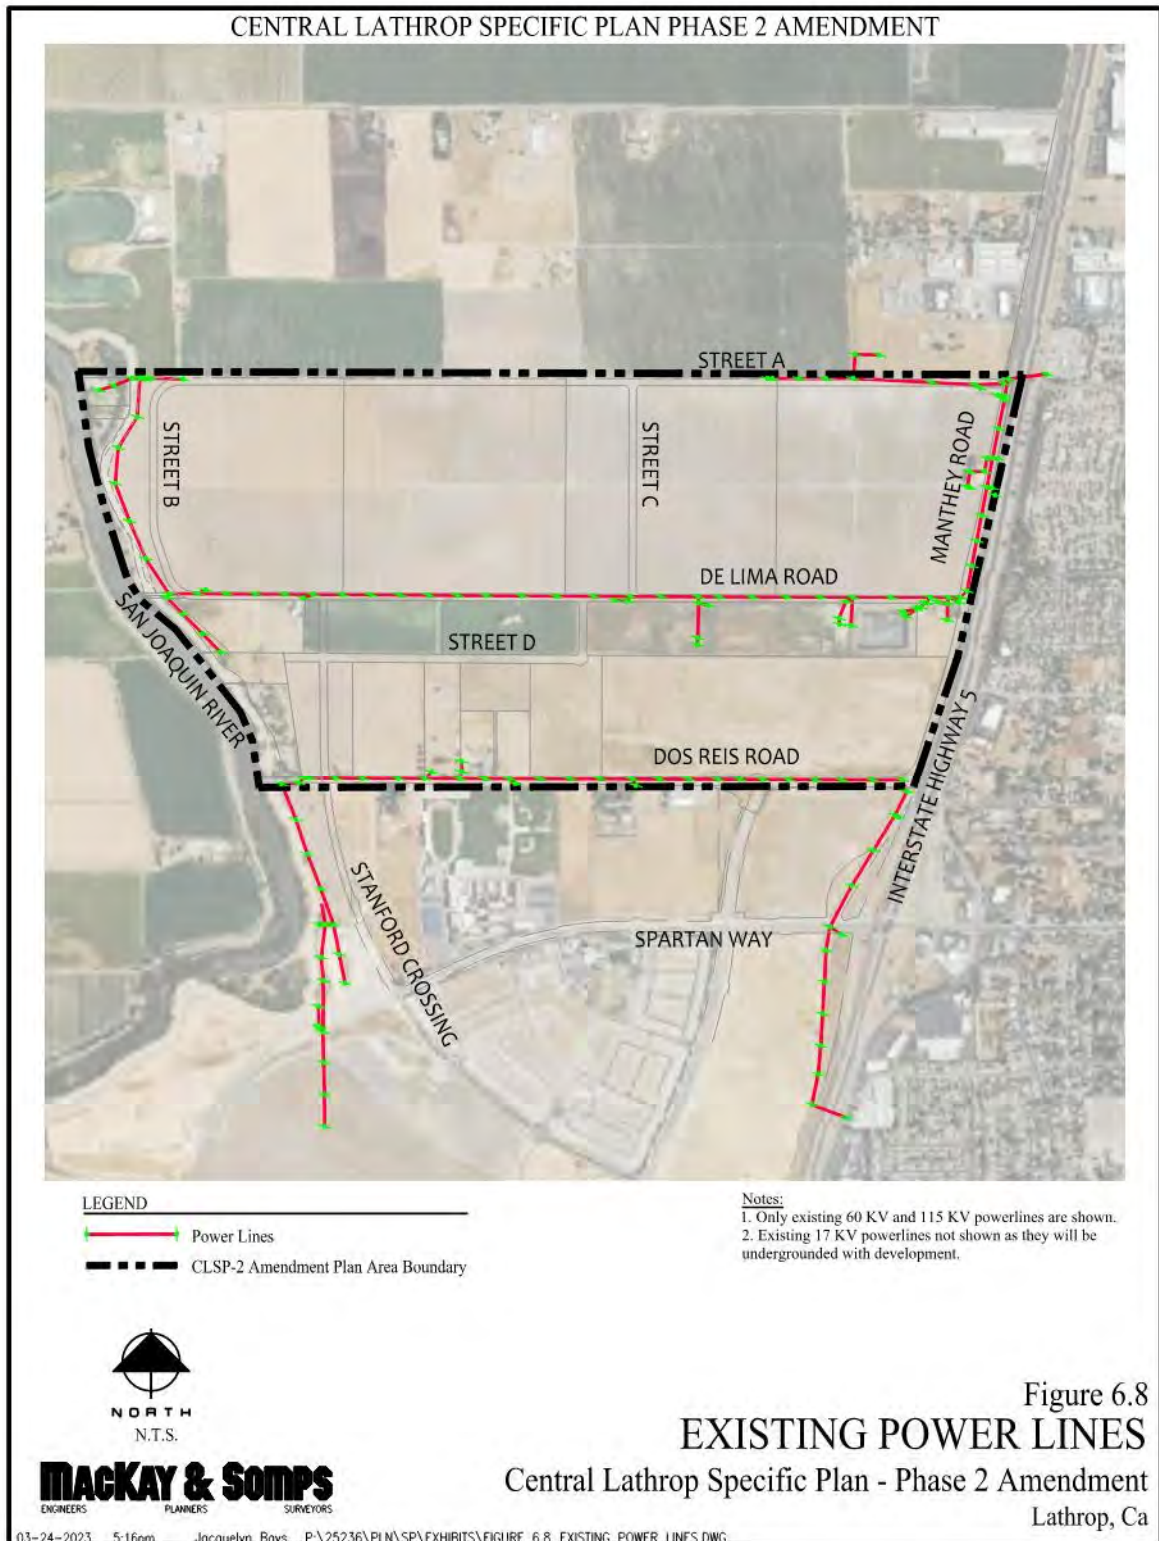

PG&E will provide natural gas service to the CLSP-2 Amendment Plan Area. The CLSP-2 Amendment Plan Area ties into existing natural gas lines located within the CLSP Phase 1 area.

Telecommunications

Telephone service, cable television service, and possibly high-speed data lines to the CLSP-2 Amendment Plan Area are to be provided by the appropriate utility companies. Telecommunication systems will be located

underground in a joint trench with gas and electric facilities.

Figure 6.8- Existing Power Lines

Chapter Seven: Design Guidelines

Introduction

The Design Guidelines provide the vision for the CLSP-2 Amendment Plan Area by establishing minimum standards for character, building design and landscape elements. The 2022 General Plan, the CLSP-2 Amendment and the City's Zoning Code, ensure a coherent well thought out design for the CLSP-2 Amendment Plan Area.

The following guidelines provide site design and architectural standards, including provisions for landscaping and sustainability efforts applicable to development within the CLSP-2 Amendment Plan Area. All development proposals in the CLSP-2 Amendment Plan Area must adhere to the standards and guidelines set forth in this amended specific plan.

These guidelines and standards are consistent with and provide a companion document to the City's Zoning Ordinance. Standards not addressed in the CLSP-2 Amendment shall be those set forth in the Lathrop Municipal Code.

Purpose

The purpose of the guidelines and standards for industrial development, park, and open space is to ensure consistency of design between the various uses within the CLSP Plan Area.

These guidelines provide for the development of a well-designed project, that is compatible with adjacent land uses of the overall CLSP Plan Area, and is designed to promote accessibility and provides the ability for pedestrians and alternative modes of transportation to, from and within the CLSP-2 Amendment Plan Area.

Land Use

A brief description and the vision of each land use designation within the CLSP-2 Amendment Plan Area are provided below:

Limited Industrial

Envisioned as a prominent employment-generating land use, this designation shall provide a high degree of functionality, including convenient access to major roadways. Buildings within this area may likely be warehouse, manufacturing, assembly and repair-type buildings. Careful consideration shall be placed in the material, color, and scale of buildings as well as the articulation of each façade. Although multiple industries would likely be located in the CLSP-2 Amendment Plan Area, the architecture styles of buildings should create cohesion and compatibility across the CLSP-2 Amendment Plan Area.

Open Space & Parks

The Open Space and Park uses are located along San Joaquin River and span the length of the CLSP-2 Amendment Plan Area Project Area. The existing Dos Reis Country Park will remain, with additional park areas proposed to connect to the open space corridor. The open space corridor along the San Joaquin River is intended as a local community wide facility with the possibility of regional linkage. This Open Space Corridor would also provide the ability to connect the CLSP-2 Amendment Plan Area to CLSP Phase 1 and other developments to the south. Though not required or mandated, provision is made within this CLSP-2 Amendment for the construction and use of outdoor recreation facilities such as recreation fields, fitness equipment and courses, or other such uses intended for the physical recreation

and well-being of the community and/or the employee users.

General principles guide the overall Central Lathrop Specific Plan - Phase 2 and lay the foundation for standards and guidelines. Standards and guidelines apply to the entire Phase 2 Amendment Plan Area, and standards and guidelines apply to each land use designation. All site design standards and guidelines are organized into two sections: 1) site design and 2) architecture. Within each section, subcategories further define and illustrate design objectives through written descriptions and photographic examples that convey desired design elements. The applicable standards and guidelines support the design objectives, defining how desired development should be achieved.

CLSP-2 Amendment Principles, Standards and Guidelines

The CLSP-2 Amendment strives for a realistic and attractive development. The CLSP-2 Amendment, within the existing and surrounding landscape, will continue to advance the economic vitality and job growth in Lathrop by creating a development of quality site design and architecture. To achieve these goals, the following planning and design principles have been developed to assist designers and developers in meeting the CLSP-2 Amendment design objectives.

All industrial projects in the CLSP-2 Amendment Plan Area should be designed to meet, or exceed the following planning and design principles:

1. Site Design.
 - a. Design pedestrian accessible buildings.
 - b. Encourage design elements that consider environmental conditions, like sun, shade, wind, etc., to improve the pedestrian experience and provide natural environmental control.

- c. Encourage streetscape with landscaping.
- d. Provide outdoor lighting for safety and security; minimize outdoor lighting from spilling over to adjacent properties.

2. Architecture.

- a. Use design styles, elements, and materials that complement or do not visually compete with surrounding context and scale of neighboring land uses within the CLSP-2 Amendment Plan Area.
- b. Incorporate distinctive design elements into buildings including colors and building relief.

Site Design

The CLSP-2 allows for a mix of industrial uses. Due to the wide variety of allowed uses for Industrial developments, circulation, site planning, landscaping, and architecture should be the key elements that unify development in the CLSP-2 Amendment Plan Area. Development projects are encouraged to provide a safe and functional environment for all users and patrons, including pedestrians, bicycles, and automobiles. Development should reflect quality and visual appeal as it relates to adjacent streets and surrounding development. This specific plan amendment guides future design for the CLSP-2 Amendment Plan Area 2 but is flexible in terms of building design, type, size and locations.

Site Planning

A. Circulation

The objective of the Central Lathrop Specific Plan - Phase 2 circulation is to promote efficient and safe movement of goods and people throughout the CLSP-2 Amendment Plan Area. The circulation design should consider all types of users: vehicle, pedestrian and bicycle.

Refer to Chapter 3 Circulation and Transportation for details on vehicle, pedestrian and bicycle route locations.

The design of access for large development areas and individual project sites should tie land uses and existing roadways into the overall circulation network in the CLSP-2 Amendment Plan Area. In some cases, the internal circulation may be part of the larger CLSP Plan Area circulation and street network.

Pedestrians should have continuous sidewalks, free of obstructions, and with convenient access to buildings and other adjacent land uses. Additionally, pedestrian connections are encouraged between site buildings, parking and other adjoining uses.

Additional modes of travel, including bicycle and public transit should be incorporated into each development project. Bicyclists should have consistent safe access from major roadways into and around each development area to minimize potential conflicts with vehicles.

1. Land uses that are automobile dependent should be designed to minimize the conflict between pedestrians, bicycles, and automobiles, by the following means:
 - Create pedestrian-only connections between public sidewalks and buildings, avoiding crossing drive-thru lanes wherever possible; or
 - Place vehicle entrances and drive-thru areas away from main pedestrian entries.

*Photo Example 1
Pedestrian facilities along public roads*

*Photo Example 2
Minimizing conflicts between pedestrians, bicycles and automobiles.*

The following circulation design guidelines apply to all development areas of the Central Lathrop Specific Plan - Phase 2:

2. Each development should provide pedestrian and bicycle connection to adjacent uses within the Central Lathrop Specific Plan - Phase 2. This would include public sidewalk connections to internal project circulation for pedestrians and public right-of-way bicycle paths to internal on and off-street routes for bicycles. These connections should be well lit and marked for the safety of its users.

*Photo Example 3
Pedestrian/bicycle safe crossing*

B. Building Placement & Parking

Building placement and orientation is key in creating a safe and efficient site design. Buildings with uses that rely on visibility should be placed close to adjacent streets and specifically on high-volume corners. Optimal building placement on individual development sites can create opportunities for public or employee spaces, encourage pedestrian connections, establish streetscapes, and provide drive-by advertising for the companies. Building placement and parking orientation considerations can greatly increase the efficiency of a building.

The following building placement and parking design guidelines apply to all individual

development sites of the Central Lathrop Specific Plan - Phase 2:

1. Where feasible and desirable, buildings should maintain close proximity to streets;
2. Buildings should be sited to be conveniently located and attract users:
 - Entrances should be designed to accommodate safe pedestrian travel;
 - Parking should have close proximity to buildings;

*Photo Example 4
Parking near buildings*

- Create spaces with gathering areas, plantings, bicycle parking, or other amenities between or adjacent to buildings;

*Photo Example 5
Encouraging gathering areas in open spaces*

- Minimize excessive building setbacks that detract from the streetscape, or optimize excessive setback areas by providing distinctive landscaping within the setback;
 - Building elevations should consider the human-scale design elements on ground floor facades and specifically at building entrances.
3. Parking areas should be designed for circulation efficiency and safety of all users:
- Large parking areas should be screened from view and placed away from major rights-of-way, behind buildings, or obscured with landscape treatments, such as berms, tall shrubs, and trees;
 - Landscaping should be provided in parking areas as specified by the landscaping section in this chapter;
 - Pedestrian pathways and walkways, clearly marked with enhanced paving material, should be provided through parking areas as direct routes to building entries.

4. Loading and delivery areas should be located appropriately to minimize their visibility, avoid pedestrian/loading zone activity conflicts, and minimize potential circulation, noise, and lighting conflicts. Screening these areas with landscaping, buildings, fences or walls is encouraged.
5. Corner and mid-block buildings should be oriented towards the public right-of-way and should be designed to achieve the following:
- Where feasible and desirable, driveway entrances and stacking lanes should be separated from public pedestrian spaces and crossings.

C. Refuse, Storage & Equipment Areas

The design and placement of refuse containers, service areas, loading docks, and similar facilities shall be considered as part of the overall site design of a project. In general, these uses should be located as to not interfere or detract from circulation, parking, and adjacent uses, and in most cases should be screened from view.

The following design guidelines apply to all development areas of the Central Lathrop Specific Plan - Phase 2 Amendment Plan Area as it relates to refuse, storage and equipment areas:

1. Trash/recycling enclosures and service and loading docks areas should be sufficiently sized to accommodate the site’s needs, but located in areas as to not interfere with on-site circulation and parking;

*Photo Example 6
Sufficiently sized loading docks*

2. Trash and outdoor storage facilities should be placed away from public streets and/or screened from view with materials consistent to adjacent building exteriors or other mature plantings; and

*Photo Example 7
Screened outdoor storage area placed away from public streets.*

3. Trash and outdoor storage that is visible from upper stories, arterial roads or freeways should be screened with trellis or other horizontal cover and should be consistent with the architectural style of adjacent buildings. Furthermore, trash enclosures should be designed—through colors, materials, details, and/or forms, that serve to compliment associated building design for the particular building complex it serves.
4. Trash and outdoor storage facilities are required to include a covered roof and sewer drain as described in the Public Works Stormwater Standards.

*Photo Example 8
Enclosed refuse areas*

D. Landscaping

The intent of the landscape design is to provide continuity throughout the CLSP-2 Amendment Plan Area. Landscaping guidelines will specify standards for streetscape, public space, and parking lot design within the development area. Through the use of deciduous and evergreen plant material, year-round interest will be given to the site with an evenly layered plant design. This layered plant design will screen or diminish adverse views and utilities. Plant materials should be easy to maintain while attractive and diverse. Designers shall emphasize the use of low-water use plants with a lush character and vibrant colors.

The streetscape within the CLSP-2 Amendment Plan Area will be unified through a consistent palette of ground cover, shrubs, and street trees. The street tree will create a canopy along all public streets to increase aesthetics of the project while providing shade and creating a walkable development. Street trees size required at time of planting will be determined during the Site Plan Review process for each development. Street trees shall be centered in the parkway strip or planted at least 4' behind the sidewalk. A mix of evergreen and deciduous trees is encouraged as primary and accent tree options. Where it is determined by City staff that more screening is required, an increase in evergreen tree locations may be required.

The landscaping of public spaces should be carefully considered to attract visitors. Trees with a consistent canopy should be used in areas where shade is desirable. In general, the landscaping of public spaces should complement the other features and amenities of the area, becoming a backdrop to pedestrian activities.

Parking lots will have drive aisles and parking aisles delineated through parking lot medians and planter strips. Ground cover, shrubs, and trees will be planted within the medians and planter strips, where feasible and practical. When a median or planter strip is adjacent to a parking

stall, all plant material and irrigation shall be kept eighteen inches from the curb, or confined to low groundcover or lawn, to allow for car overhang and door swing. Trees should provide a shade canopy, reducing heat island effect: a sustainable site planning measure. It is recommended that 50% shade be provided within vehicular parking lots. (Estimated shade diameter is projected at 15 years from time of planting.) Vehicular parking lot shade trees shall conform, at a minimum, to standards and requirements shown in Chapter 17.9 Landscape and Screening Standards of the Lathrop Municipal Code.

Irrigation and water efficiency/conservation is mandatory in accordance with the "Model Water Efficient Landscape Ordinance." Irrigation systems should be designed to ensure the efficient use of water and avoidance of overspray and overwatering. To help ensure an efficient irrigation system, plants should be grouped in hydro-zones, which is a combination of plants with similar water needs. The use of low-water native and adaptive plants is highly encouraged. All landscape areas must be irrigated with an automatic irrigation system controlled by a timer. Use of drip irrigation is encouraged where practical and most effective, especially in shrub and tree areas.

Where feasible and desirable, drainage and water quality measures should be used in on-site landscape areas. Using landscape strips and medians for percolation, drainage swales, and rain gardens is highly encouraged. Use of many sustainable landscape techniques is highly recommended and can result in substantial maintenance cost savings.

The following design guidelines apply to all development areas of the Central Lathrop Specific Plan - Phase 2 as it relates to landscaping:

1. Landscaping should be used to define outdoor spaces, softening and complementing structures, and should also be used for utilitarian qualities:

- Become a backdrop to pedestrian outdoor gathering places;
- Screening parking, loading, storage, and equipment areas;
- Provide shade and enhancement to the streetscape, parking lots, and pedestrian outdoor gathering places; and
- Directional, defining entries and pedestrian ways.

2. Landscaping and trees should be employed in parking areas to break up expanses of hardscape and to minimize heat island effect;

*Photo Example 9
Landscaping in parking areas*

3. Where feasible and desirable, mature trees and plantings should be maintained and incorporated into the landscape design;
4. Natural and existing vegetation should be preserved where possible and incorporated into the new landscaping. Retention and detention areas should be planted to create the appearance of natural vegetation. Careful selection of plant types is necessary to ensure survival and be compatible with the proper functioning of the drainage system;

*Photo Example 10
Preserved Natural Vegetation*

5. Conservation and efficient use of water is at the forefront of the Central Lathrop Specific Plan - Phase 2 landscaping objectives. Landscaping and irrigation shall comply with the City Municipal Code Section 17.92.060 “Water Efficient Landscape Ordinance” and the following guidelines:

- Plants should be selected and grouped according to their maintenance and water use profile. In all cases, low-maintenance and drought tolerant plantings are highly encouraged;
- Planting of turf areas should be kept at a minimum. A maximum of 10% of the total landscaped site area may be irrigated turf. Drought-tolerant ground covers and shrubs are lower maintenance and seen as more desirable;
- All landscaped areas should be designed for maximum water efficiency and irrigated through an automatic irrigation system controlled by a timer. Non-potable or recycled water should be used to the extent feasible;

- Use alternative and porous paving options for pedestrian pathways and non-vehicular and bicycle circulation to maximize infiltration of water runoff;
 - Curb, header boards, pavers, and other materials should be used to minimize water run-off and define landscaped areas; and
 - Water features should be designed for maximum maintenance and water efficiency.
6. Where feasible and desirable, landscape strips and medians should be programmed for the treatment and conveyance of water run-off. Landscaping used for percolation, drainage swales, and rain gardens are highly encouraged.
7. A landscape buffer shall be provided along Dos Reis Road, across from existing and proposed sensitive receptors. The landscape buffer is intended to soften the transition from non-industrial uses to the future industrial uses of the site. A 30 minimum foot wide landscape buffer including 22 feet of landscaping with an 8 foot wide paved trail will be provided in the public right-of-way behind the curb. An additional buffer will be provided on private property to be designed with individual development applications. Refer to the Land Use chapter of this specific plan amendment for additional information.

*Photo Example 11
Landscape buffer at entry monumentation*

E. Walls & Fences

Walls and fences in the Plan Area are intended to provide screening between projects and adjacent uses where necessary, helping to define edges of arterial and collector streetscapes and providing security to property. It is anticipated that there will be limited use of walls, except where needed for sound attenuation or where desired for entry features or for screening unsightly elements, such as trash areas. The material and design for the walls and fencing may vary throughout the development area, depending on location and specific project needs. However, the color and materials of the walls through the CLSP-2 Plan Area should be complimentary. Both masonry and wood fences are permitted in the Plan Area.

The following design guidelines apply Central Lathrop Specific Plan - Phase 2 as it relates to walls and fences:

1. Walls and fences will not be permitted if they aren't necessary for noise attenuation, specific screening, gateway, aesthetic, or security purposes;

*Photo Example 12
Site walls and fences*

2. Tall walls and fences are discouraged along arterial and collector roadways, as they diminish the street scene. Fences and walls should not exceed a maximum height of seven feet, unless special screening and/or security issues are demonstrated which necessitates a higher fence. Low decorative or auto-screening walls, 2 to 4-feet in height, may serve to enhance a building area or streetscape, if tastefully designed. Maximum wall heights should be inclusive of fill from existing ground (ie berms). At locations where industrial land use is proposed adjacent to sensitive receptor land use (like along Dos Reis Road), an 8 ft. masonry wall for special screening shall be installed;
3. Walls and fences, used at property frontages or for screening, should be designed as an extension of a building’s architecture; top caps on masonry walls and tubular steel fences are encouraged. Self-clinging or supported vines shall be planted at regular intervals along walls to ensure coverage within 5 years in order to discourage graffiti and soften the overall appearance of the wall;
4. Where long expanses of wall or fence are unavoidable, articulation in the form of wall offsets or landscaping should be implemented; and

*Photo Example 13
Landscape screening at wall*

5. Where security fencing is required, a combination of solid and open grill work is encouraged. Barbed, razor, wire or similar fences shall comply with LMC Section 17.92.070.
6. At the interface between Dos Reis Regional Park and the adjacent industrial site a shall include a masonry wall for screening.

F. Public Spaces and Pedestrian Amenities

It is the intent of the public spaces and pedestrian amenities section to promote usable public gathering spaces oriented toward pedestrian users that function as an amenity to the development. These outdoor spaces should be visually pleasing, appropriately scaled, and should encourage greater activity within each development area. As well as providing pedestrian-oriented features and amenities, these spaces should connect pedestrians with the site and surrounding uses.

An employee or public gathering place should be provided for appropriate projects in each development area. The scale and program of the

space should be appropriate to the adjacent building and type of users. It is encouraged to site these spaces in well-lit, shaded, secure, and interactive areas where they can become an integrated feature.

*Photo Example 14
Shaded employee break area*

*Photo Example 15
Employee well-being area*

2. Within the Limited Industrial designation, gathering places should be placed between or adjacent to buildings to encourage employee health and well-being.

*Photo Example 16
Employee break area*

The following design guidelines apply to all of the Central Lathrop Specific Plan - Phase 2 as it relates to public spaces and pedestrian amenities:

1. An employee or public gathering and break area spaces should be encouraged in appropriate projects within each development area. These amenities can include, but are not limited to, small recreation areas or other open space facilities. These areas will count toward the landscape requirement designated for each land use district.

3. Pedestrian connections should be established within projects and development areas, where logical and practical. Areas for respite for users should be encouraged.

G. Lighting & Furniture

Lighting is an important element in the landscape and should be used to contribute to a safe and attractive environment. Natural areas will need little light while street intersections will require illumination levels safe for pedestrian crossings. Lighting is also used to reinforce the development's overall design theme and create a consistent sense of place by adding a common,

thematic element that is repeated along all major roadways. Streetlighting within public right of way shall comply with the City of Lathrop design & construction standard details. The height of lights will vary depending on application. Light standards will typically be higher along roadways and will be lower in pedestrian areas. High Efficiency lighting is required within all buildings as well as on the exterior. Outdoor lighting shall be provided for safety and security but shall be minimized from spilling over to adjacent properties.

Site furniture is encouraged in outdoor areas and public spaces. The driving goal for the use of landscape elements is to create enjoyable outdoor spaces and furnish comfortable amenities for relaxation and leisure. Site furniture visible from public streets, plazas, and pedestrian linkages should be of a compatible style and design. Fixtures and furniture may vary in style, color, and materials from this standard design if they are used in enclosed courtyards or other locations where land uses require unique appeal. Designers shall give emphasis to vandalism-resistant criteria when selecting all site fixtures and furniture.

The following design guidelines apply to all of the Central Lathrop Specific Plan - Phase 2 as it relates to lighting and furniture:

1. Outdoor lighting should be specified and designed consistent with the zoning code for this Plan Area;
2. Exterior lighting, including parking areas, should be architecturally integrated with the style of the building and colors and materials used;
3. Parking lighting should be arranged to provide uniform illumination throughout parking areas and should achieve a minimum average of one foot-candle and a maximum of three;
4. Low energy LED lighting should be used for streetscapes and parking lots.

5. Architectural lighting may be used to highlight special features on or around the building, or to illuminate key entrances or other areas of access;
6. All lighting should utilize cut-off type fixture to minimize visibility from adjacent areas and should be the appropriate size and height given the activities for which they are designed. Lighting used for pedestrian connectors and gathering spaces should be lower, bollard-type or footlight fixtures and should not exceed 3-4 feet in height;
7. Where feasible and desirable, the use of pedestrian amenities, such as benches, drinking fountains, lighting, and trash receptacles, is encouraged. These elements may be sited in public gathering places and as respite along pedestrian connectors; and
8. The design of site lighting and furniture should be compatible throughout the CLSP-2 Amendment Plan Area.

Architecture

Architecture should establish project identity and enhance the character of the development in the CLSP-2 Amendment Plan Area and the City of Lathrop. As a high-quality development, a complementary design language should be established throughout the CLSP-2 Amendment Plan Area.

The architecture section is divided into two sub-sections:

- Massing, Scale, and Form
- Style and Design Details

A. Massing, Scale and Form

The design objective of this section is to encourage buildings that consider the human scale, include active areas, and are compatible with adjacent development. Buildings should be clustered to create compact, multi-story

structures that concentrate activities and related programmatic uses. Building height and massing should consider the surrounding context. Projects should consider the human scale at the ground floor and at entries to buildings. Buildings should take on varying form to increase visual interest and break up the monotony of large structures. In addition, horizontal and vertical wall articulation should be encouraged through the use of wall and second floor offsets, recessed entries and windows, human-scale awnings, overhangs and arcades.

*Photo Example 17
Visual interest in articulation*

B. Style and Design Details

The objective of the style and design detail section is to establish clear direction in terms of architectural styles and themes for future development in the CLSP-2 Amendment Plan Area. The style and design of the buildings will enhance the character of the Central Lathrop Specific Plan - Phase 2 and set it apart as a distinct and high-quality development. While these guidelines do not prescribe a specific style of architecture for the CLSP-2 Amendment Plan Area, the objective is to allow a diversity of styles while considering the context of surrounding development.

C. Roofline

1. Rooflines should be clearly articulated by using the following feature:

- Parapets are encouraged to conceal flat roofs and to screen any rooftop equipment, such as HVAC units, from public view. Parapets should not exceed 15% or 1/3 of the supporting wall height. All parapets should feature three-dimensional cornice treatments.

D. Entries

1. Building entrances should be designed for access both by patrons arriving via automobile and by foot or bicycle;
2. Each entry should be protected from the elements;

*Photo Example 18
Entry protected from the elements.*

3. Entries should create an architectural point of interest using one or more of the following methods:
 - Wall recesses;
 - Roof overhangs;
 - Canopies;
 - Arches or arcades;
 - Columns; and/or
 - Signage.

*Photo Example 19
Architectural points of interest at entryways*

*Photo Example 20
Architectural color, texture and material changes with offset/projections*

4. Entries should incorporate windows to provide natural light and air; and
5. Where feasible and desired, pedestrian amenities, such as seating, lighting, fountains, sculptures, boulders, etc., should be incorporated into entry designs

E. Materials & Colors

1. All building elevations must include architectural patterns that include at least (2) of the following elements:
 - Color change;
 - Texture change;
 - Material change; and/or
 - A wall offset, reveal, or projection of at least 12 inches in depth.

2. Exterior materials should be durable and high quality to prevent degradation and for the ease of maintenance:

- Large expanses of smooth material such as concrete should be broken up with expansion joints, reveals, recesses, or changes in texture and color;
- Large expanses of highly reflective surface and mirror glass exterior walls should be avoided to prevent heat and glare impacts on the adjacent public streets and properties;
- Colors should be compatible throughout the CLSP-2 Amendment Plan Area, while allowing for individuality to each development area. A varied and rich color palette is encouraged, although color should not be used as an attention-seeking device. Colors should be used to enhance a building’s presence and integrate other materials throughout the project;

3. Building trim and other accent elements may feature brighter colors, if desired, but should always complement the base color.

*Photo Example 21
Contrast in reflective surfaces – pop of color trim accents*

F. Windows & Doors

1. Ground floor, storefront-type glazing for display purposes along public façade frontages should be used as appropriate to enhance the exterior wall area;
2. Windows and/or other appropriate building features should be used on upper levels to break up large wall areas and create visual interest;

*Photo Example 22
Window placement at upper levels - creating visual interest with architectural elements*

3. Window and door openings should be framed with trim, or recessed a minimum of 4 inches from the building face;
4. Where feasible and useful, use operable windows for maximum environment control and passive heating/cooling options

G. Facades

1. Facades of 100-feet or more in length are encouraged to break-up the elevation using one of the following techniques:
 - Wall and/or second floor offsets; or
 - Recessed entries or windows.
2. Facades that face public streets should create visual interest by using one or more of the following techniques:
 - Human-scale elements, like awnings or overhangs;
 - Arcades or recesses; or
 - Entry areas.

*Photo Example 23
Human-scale awning element*

H. Signage

1. Signage shall comply with Lathrop Municipal Code Chapter 17.84 Signs;

2. Color and material options for signs should always complement the architectural style of the building;
3. Signage should be scaled appropriately for its given location;
4. Building signage should be located near the related business entry, or as identity feature as seen from major travel ways;

*Photo Example 24
Monument signage*

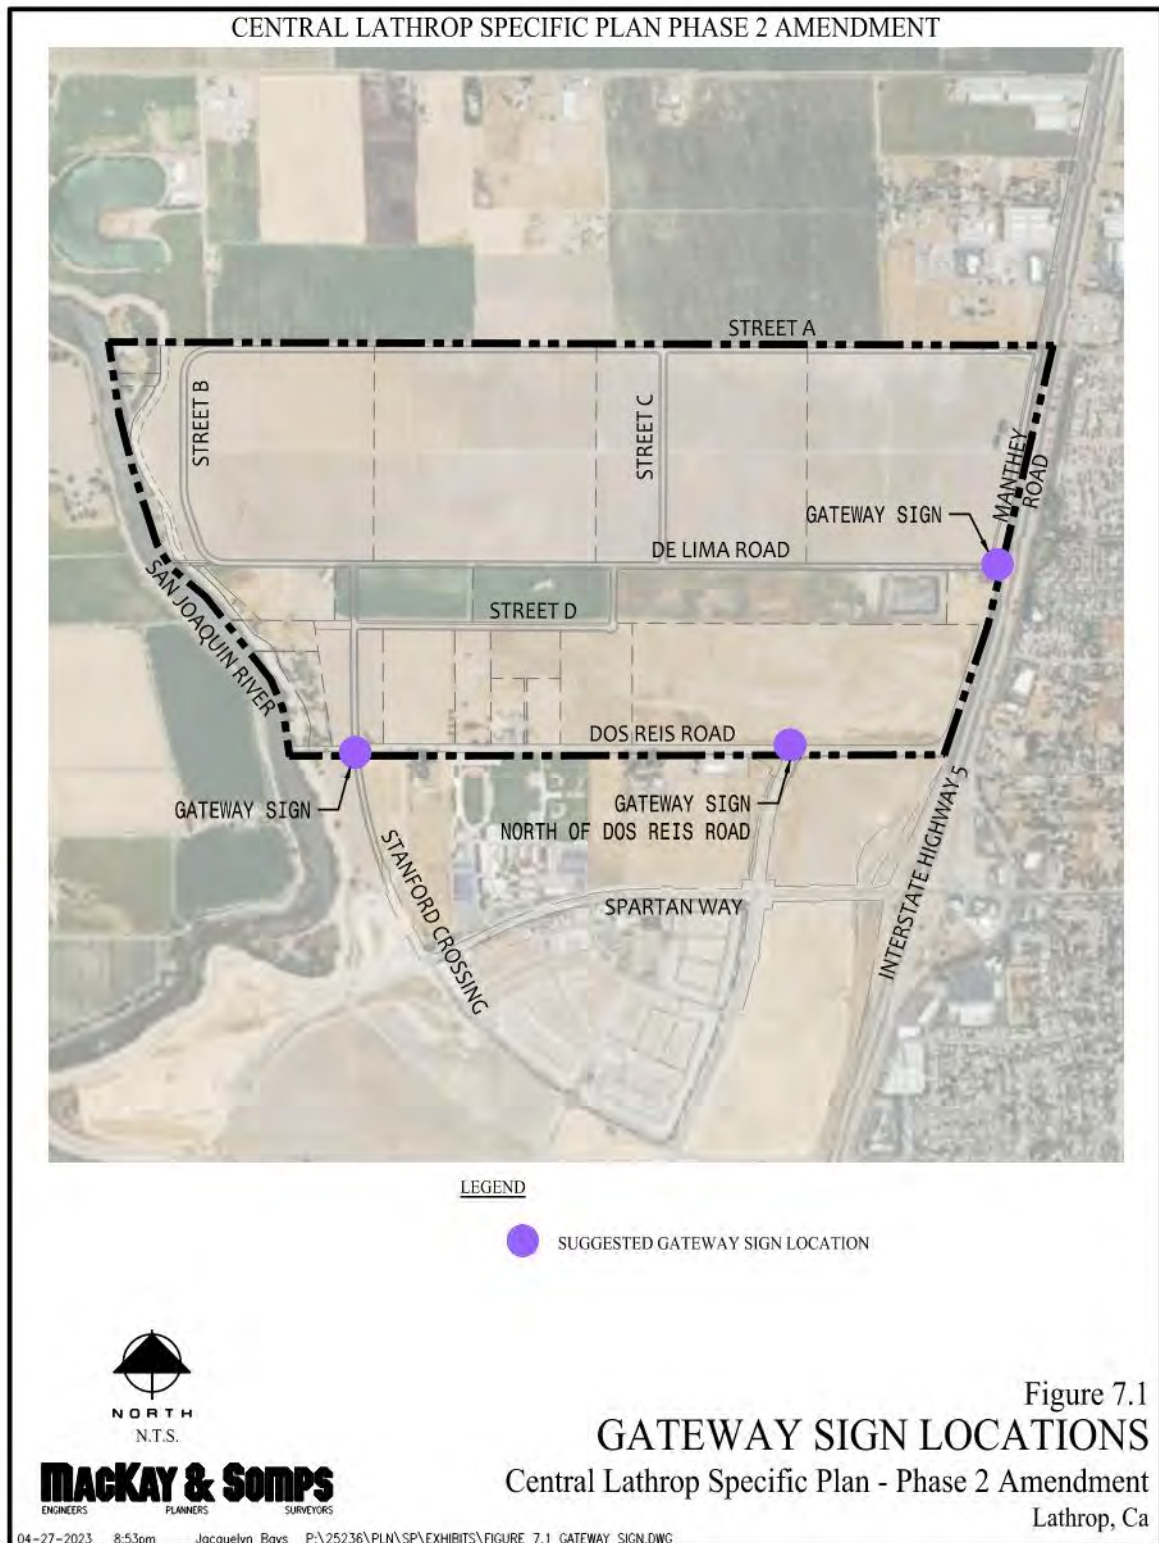

*Photo Example 25
Low profile monument sign*

5. Signage should maintain a visual consistency throughout CLSP-2 Amendment Plan Area. When more than one sign is required for a given business or area, both signs should maintain visual compatibility with one another;
6. Signage text should be kept to a minimum and scaled appropriately for placement and legibility purposes;
7. Wall signs, monument signs, and low-profile freestanding signs are encouraged;

8. Signage for pedestrian and bicycle way-finding is encouraged; and
9. Lighting is allowed to illuminate signage at night. Lighting should be designed appropriately as to not create hazardous glare for pedestrians, bicyclists, and vehicles. Both externally and internally illuminated signage is allowed.
10. At key entry areas along De Lima Road, Manthey Road, and future Street A, project-wide decorative entry features and monument signs shall be located to identify and enhance the image of the Central Lathrop Specific Plan - Phase 2 Area. Developers and builders of the project shall work with City Staff to establish appropriate locations and criteria for this project-wide monumentation and signage.
11. On-site directional signs at gateways and entries are encouraged to be provided for both pedestrian and vehicular visitors to the site.
12. Suggested Gateway Sign locations are shown on Figure 7.1.

Figure 7.1- Gateway Sign Locations

Chapter Eight: Implementation

Introduction

This chapter describes the CLSP-2 Amendment implementation, including project review procedures, development agreements, specific plan amendment procedures, enforcement, mitigation monitoring and other review and approvals required during the implementation of the CLSP-2 Amendment.

Specific Plan Implementation

The City would implement the CLSP-2 Amendment in accordance with the terms and conditions of several related planning and program documents, including, in particular, the landowner development agreements, the project CEQA analysis, the CLSP-2 Amendment Design Guidelines (this document), the City of Lathrop General Plan, related Master Plans, and the Zoning Ordinance. These documents provide guidance and direction and otherwise inform City discretion in the review and approval of future development within the CLSP-2 Amendment Plan Area.

Central Lathrop Design Guidelines

As described in Chapter Seven, the CLSP-2 Design Guidelines contain architectural, site planning, and landscaping design principles and guidelines.

City of Lathrop General Plan

Development within the CLSP-2 Amendment Plan Area must be consistent with the City of Lathrop General Plan.

The Lathrop General Plan requires Conditional Use Permits for industrial

development located between Dos Reis Road and De Lima Road.

Municipal Code

The City of Lathrop Municipal Code has been amended to include special zoning districts for the purpose of defining for each parcel the permitted, conditionally permitted, and administratively permitted land uses that may be developed within the CLSP-2 area, the process pursuant to which such land uses are approved and the development standards applicable to each land use.

Drainage Plan Implementation

A detailed drainage report, including hydrologic and hydraulic calculations and focused geotechnical investigations relating to soil and groundwater conditions, will be a critical part of the individual application for each project proposed for development.

There are two distinct watersheds within the CLSP-2 Amendment Plan Area. The parcels within each watershed are linked by the drainage system and therefore, the detailed planning of any portion of a watershed must take into consideration the rest of the proposed development within that watershed.

If an individual development does not encompass the entire watershed, the individual project must show that it will implement the requirements of the CLSP-2 Amendment Drainage Plan as described in the Utilities and Drainage chapter.

Right to Farm Provisions

The Plan Area has existing agricultural uses of various kinds and intensities. As the Plan Area builds out, several existing parcels on-site could remain in their existing agricultural state for some foreseeable period of time. In order to ensure the viability of the on-going agricultural uses, this specific plan amendment shall require that a “right-to-farm” provision be included as a part of any subsequent stage in the land entitlement process. Along these same lines, an entitlement application or document shall mandate full right-to-farm disclosures at point-of-sale of lots within the Plan Area. This provision shall include all properties on site which may be impacted or affected by on-going farming operations.

Development Agreements

Subject to the Specific Plan, the property owners and the City may execute Development Agreements in accordance with Government Code and local ordinance. The Development Agreements will set forth the infrastructure improvements, public dedication requirements, landscaping amenities, and other contributions to be made by a property owner in return for guarantees by the City that certain land uses and densities in effect at the time of execution of the agreement will not be modified.

Both the City and the project sponsors would commit themselves to proceed with the terms of the agreement. The City can agree to process future development applications in accordance with the Plan and laws that were in existence when the agreements were made. The City then commits to maintaining its planning or zoning statutes related to the developments for an agreed-upon period of time. In return, the developer/applicant agrees to develop according to an agreed-upon time schedule or commit to other measures which the City might otherwise have no authority to require the developer/applicant to perform.

Generally, Development Agreements include the following provisions, or similar variations:

- Specify how the Specific Plan and General Plan will be implemented in connection with the Development Agreement,
- Provide the terms for reimbursement in the event that a developer provides advance funding for facilities which have community benefit,
- Provide for adequate public facilities for each project phase in a timely manner,
- Shorten the approval process by consolidating and coordinating various discretionary approvals, and
- Specify the monetary responsibilities of the developers.

City Review Process

Community Development Department Review

Subsequent to adoption of the CLSP-2 Amendment, individual project applications will be reviewed to determine consistency with the specific plan amendment and other regulatory documents. Applications such as site plan review applications, use permits, conditional use permits, variances and the like, will be reviewed using established Community Development Department and Planning Division procedures.

Development applications will be submitted to the City of Lathrop’s Planning Division. The Planning Division will conduct an initial review of the application for completeness and consistency with the adopted Specific Plan, as well as other ordinances and standards. The applicant will be notified within 30 days of the initial submittal date of any deficiencies that must be rectified to deem the application complete. If the applicant or the City believes that an Amendment to the Specific Plan is warranted, an Amendment to the Specific Plan may be requested in accordance with the Amendment Procedures. The request must provide adequate

justification. The application may also be subject to environmental review as discussed in the following section.

Conditional Use Permits (CUP)

Per the City of Lathrop General Plan, conditional use permits will be required for any development within the CLSP-2 Amendment Plan Area located between Dos Reis Road to the south and De Lima Road to the north. A CUP may also be required within the CLSP-2 area if the proposed use requires a CUP per the Lathrop Municipal Code.

Site Plan/Architectural Design Review

Generally, all industrial projects within the CLSP-2 Amendment Plan Area will be subject to Site Plan/Architectural Design Review by the City; design review shall be implemented before issuance of building permits. Also, all public improvements (such as landscape plantings, street and entry signs, lighting, or special paving) are subject to Site Plan/Architectural Design Review. All Site Plan/Architectural Design Review procedures will be conducted in compliance with Chapters 17.100 and 17.104 of the Lathrop Municipal Code.

Public Improvement Plans

The on-site and off-site public improvements necessary to serve the CLSP-2 area need to be specifically designed. The applicants shall prepare for City review and approval Public Improvement Plans, consisting of detailed engineering designs and documents for all utilities necessary to develop the land uses identified in the Specific Plan. These plans shall include an infrastructure sequencing program that will allow orderly development throughout the Specific Plan area. The sequencing program shall prioritize roads, water, sewer, storm drainage and other utilities that must be in place prior to specific levels of development. Refer to Section 6.3.3 for additional details regarding infrastructure phasing.

Environmental Review

The EIR certified for the 2022 General Plan established a program level environmental review for development within the City including the CLSP-2 Amendment Plan Area and supports the Amendment. Individual project applications will be reviewed for consistency with the 2022 GP EIR. If consistency is determined and the project meets the criteria established in Section 15162 of the CEQA guidelines no subsequent environmental review is necessary. The intent of the EIR associated with the specific plan is to cover all development consistent with this document, stream-lining the permitting and review process.

The City of Lathrop Community Development Department is the lead agency in processing the review of development projects within the Plan Area. Upon receipt of an application the City shall initiate an initial study and environmental review of the project which may require the preparation of additional environmental or engineering studies to address site-specific concerns.

The foregoing discussion details the initial project review and environmental review submittal procedures. Projects submitted for consideration will be reviewed for consistency with established development standards and design guidelines of the Specific Plan.

Habitat Conservation Plan

All individual project applications must comply with the San Joaquin County Multi-Species Habitat Conservation and Open Space Plan (SJMSCP). The SJMSCP, prepared by San Joaquin County and other participating agencies, protects special-status plants and wildlife and their habitats, while allowing for planned growth in the County. This protection is accomplished by, 1) identifying important habitats and habitat features to aid in the development of protection areas, and 2) establishing a funding mechanism through which project proponents can provide

replacement habitat while enabling them to meet their no net loss of habitat value goals. Project proponents as part of this Specific Plan will be required to participate in the SJMSCP by contributing appropriate impact fees and implementing mitigation as identified by the SJMSCP.

Amendments to CLSP-2

An applicant for a specific development proposal may request amendments to the CLSP-2 to respond to changing circumstances and conditions. Amendments to the CLSP-2 should be categorized as minor or major. This determination is to be made by the Community Development Director or his/her designee. The Community Development Director or his/her designee shall administratively make a written determination as to whether or not a requested amendment is major or minor. The Community Development Director's decision may be appealed to the Planning Commission.

Major Amendments

The following are examples of what could be considered major amendments:

- Introduction of a new land use category not specifically discussed in this CLSP-2.
- Significant changes to the distribution of land uses, major acreage changes of land uses, or other changes affecting land use which may substantially affect the key planning concepts set for this in this CLSP-2.
- Significant changes to the collector street system that would substantially alter the land use or circulation concepts set forth in this CLSP-2.
- Changes to design guidelines and/or development standards which, if adopted would substantially change the

physical character of the plan area as envisioned by this CLSP-2.

- Any change that could significantly increase environmental impacts.

All Amendments to CLSP-2 shall be consistent with the City's General Plan. Major amendments may therefore require an accompanying General Plan Amendment and Zoning Ordinance revision. Generally, the process for amending the CLSP-2 Amendment is similar to that for amending the City's General Plan, with the main difference that there is no limitation of the number of amendments that may be approved in any one year. The materials and documents necessary to process a major amendment application should be consistent with those outlined in the City's Discretionary Permit Form for Rezones/Amendments. A detailed justification statement shall be submitted which explains in detail why an amendment to the CLSP-2 Amendment is warranted. All requirements of CEQA will be applicable. Application fees associated with the major amendment shall be submitted to cover all processing costs. Major amendments shall require City Council approval, with a recommendation forwarded by the Planning Commission.

Minor Amendments

An amendment shall be considered a minor amendment when it is determined that it does not have a significant impact on the character of the plan or the environment. The following are examples of what could be considered minor amendments:

- Change in the configuration of a particular CLSP-2 Amendment land use which does not significantly alter its relationship to other land uses or compromise the concept and principles of the CLSP-2 Amendment.

- Minor changes to land uses which result in minor acreage changes of land uses, or other changes altering land uses, which do not significantly affect the key planning concepts or principles set forth in this CLSP-2 Amendment.
- Changes to the collector street system and alignments that do not significantly alter the intended land uses or circulation functioning as set forth in this CLSP-2 Amendment.
- The relocation or reconfiguration of open space that is not less in acreage size than specified minimums in the CLSP-2 Amendment.
- Changes to design guidelines (architectural types and materials, landscape materials, etc.) and/or development standards that do not substantially change the physical character of the CLSP-2 Amendment development as envisioned.
- Clarification and interpretation of land uses.
- Any change to the CLSP-2 Amendment that would not significantly increase environmental impacts.

Applications for minor amendments shall be submitted to the Planning Division and shall include a description of the requested amendment, a justification statement, and the application processing fee (determined by the City Council). Minor amendments shall require Community Development Director approval.

An amendment or amendments to this CLSP-2 Amendment shall not require a concurrent general plan amendment unless City Staff determines that the proposed specific plan amendment would not be consistent with the General Plan goals, objectives, or policies.

Overview of Development Approval Process

The approval of any development project within CLSP-2 Amendment Plan Area shall be based on its consistency with the Lathrop General Plan, the CLSP-2 Amendment, the CLSP-2 Amendment Design Guidelines, and the Lathrop Zoning Code. In addition, each application for a development project within the CLSP-2 Amendment Plan Area will be evaluated to assess the applicability of environmental mitigation measures included in the 2022 Lathrop General Plan EIR to determine whether future environmental review is required under CEQA (Public Resources Code Sections 21166; 21083.3. See also CEQA Guidelines Sections 15162-15164, 15182, and 15183).

Development projects within the CLSP-2 Amendment Plan Area are subject to the standard permit and approval requirements of the City of Lathrop's Zoning and Subdivision Ordinances, except as modified by this Specific Plan Amendment and related approvals.

Site Plan Review Conditional Use Permits, Variances, and other permits for individual development projects

Site Plan/Architectural Design Review

Generally, all industrial projects within the CLSP-2 Amendment Plan Area will be subject to Site Plan/Architectural Design Review by the City; design review shall be implemented before issuance of building permits. Also, all public improvements (such as landscape plantings, street and entry signs, lighting, or special paving) are subject to Site Plan/Architectural Design Review. All Site Plan/Architectural Design Review procedures will be conducted in compliance with Chapters 17.100 and 17.104 of the Lathrop Municipal Code.

Conditional Use Permits

The development of certain land uses within the CLSP-2 Amendment Plan Area or within certain locations may require a conditional use permit (CUP) based on the Lathrop Zoning Ordinance. Issuance of conditional use permits are governed by Lathrop Municipal Code, which specifies the application process, including the submittal of plans, processing fees and related information as may be needed. CUPs are subject to a public hearing held by the Planning Commission that must make findings prior to approval.

The 2022 Lathrop General Plan, Land Use Element, Implementation Action, LU-5.f, b., iii., h., requires that all development projects proposed north of Dos Reis Road and south of De Lima Road be required to obtain a Conditional Use Permit (CUP), which shall be subject to discretionary review by the City Council.

Variations

In some instances due to special circumstances applicable to a property, Chapter 17.120 of the Lathrop Municipal Code authorizes the Planning Commission to consider and grant “major” variances to specific development standards as set forth in the zoning code. The Community Development Director may consider and grant “minor” variances. Chapter 17.120 of the Municipal Code includes a discussion of major and minor variances, submittal requirements and requirements for a public hearing.

Building, Grading and Demolition Permits

A building permit is required prior to the construction, alteration, or renovation of buildings, including interior improvements. Grading permits are required for the excavation, fill or moving of dirt in excess of 50 cubic yards on any building site within the CLSP-2 area. Issuance of a demolition permit by the Lathrop Building Department is required prior to removal of existing buildings.

Phasing

The implementation program for the CLSP-2 Amendment is designed to allow development of the CLSP-2 Amendment Plan Area and construction of supporting public improvements to be phased. Phasing is a critical component of the CLSP-2 Amendment for the following reasons:

- It allows the backbone infrastructure necessary to support development to be constructed and financed in manageable increments on an as-needed basis.
- It assures the construction of backbone infrastructure will stay ahead of the development it serves while, at the same time, providing the flexibility to respond to changes in market conditions.
- It is more efficient because it minimizes the extent to which costly public improvements requiring on-going maintenance will be constructed only to sit unused until development occurs.
- It provides an opportunity to coordinate land secured infrastructure financing more closely with market absorption resulting in higher lien to value ratios.

The CLSP Phasing Program

The CLSP-2 Amendment land uses, and the backbone infrastructure (refer to Chapter Six for details), are designed to be developed in two primary phases, with the possibility of multiple sub phases. The two primary phases of development are shown in Figure 8-1. Both development phases within the CLSP-2 Amendment Plan Area rely on infrastructure that was constructed to the south within the original CLSP Phase 1 Plan Area such as the underground utilities and pump stations. Reimbursements for the oversized utilities within the original CLSP Phase 1 Plan Area will be paid through the City of Lathrop’s Capital Facility Fee (CFF) Program.

The first phase of the CLSP-2 Amendment Plan Area is a single parcel adjacent to Dos Reis Road near the intersection of Golden Valley Parkway that is approximately 90 acres. The second phase is the remaining area within the CLSP-2 Amendment Plan Area. Development phasing may be further divided into sub-phases as market conditions and infrastructure financing options warrant. The timing of the ultimate buildout will depend upon market conditions.

Infrastructure Administration

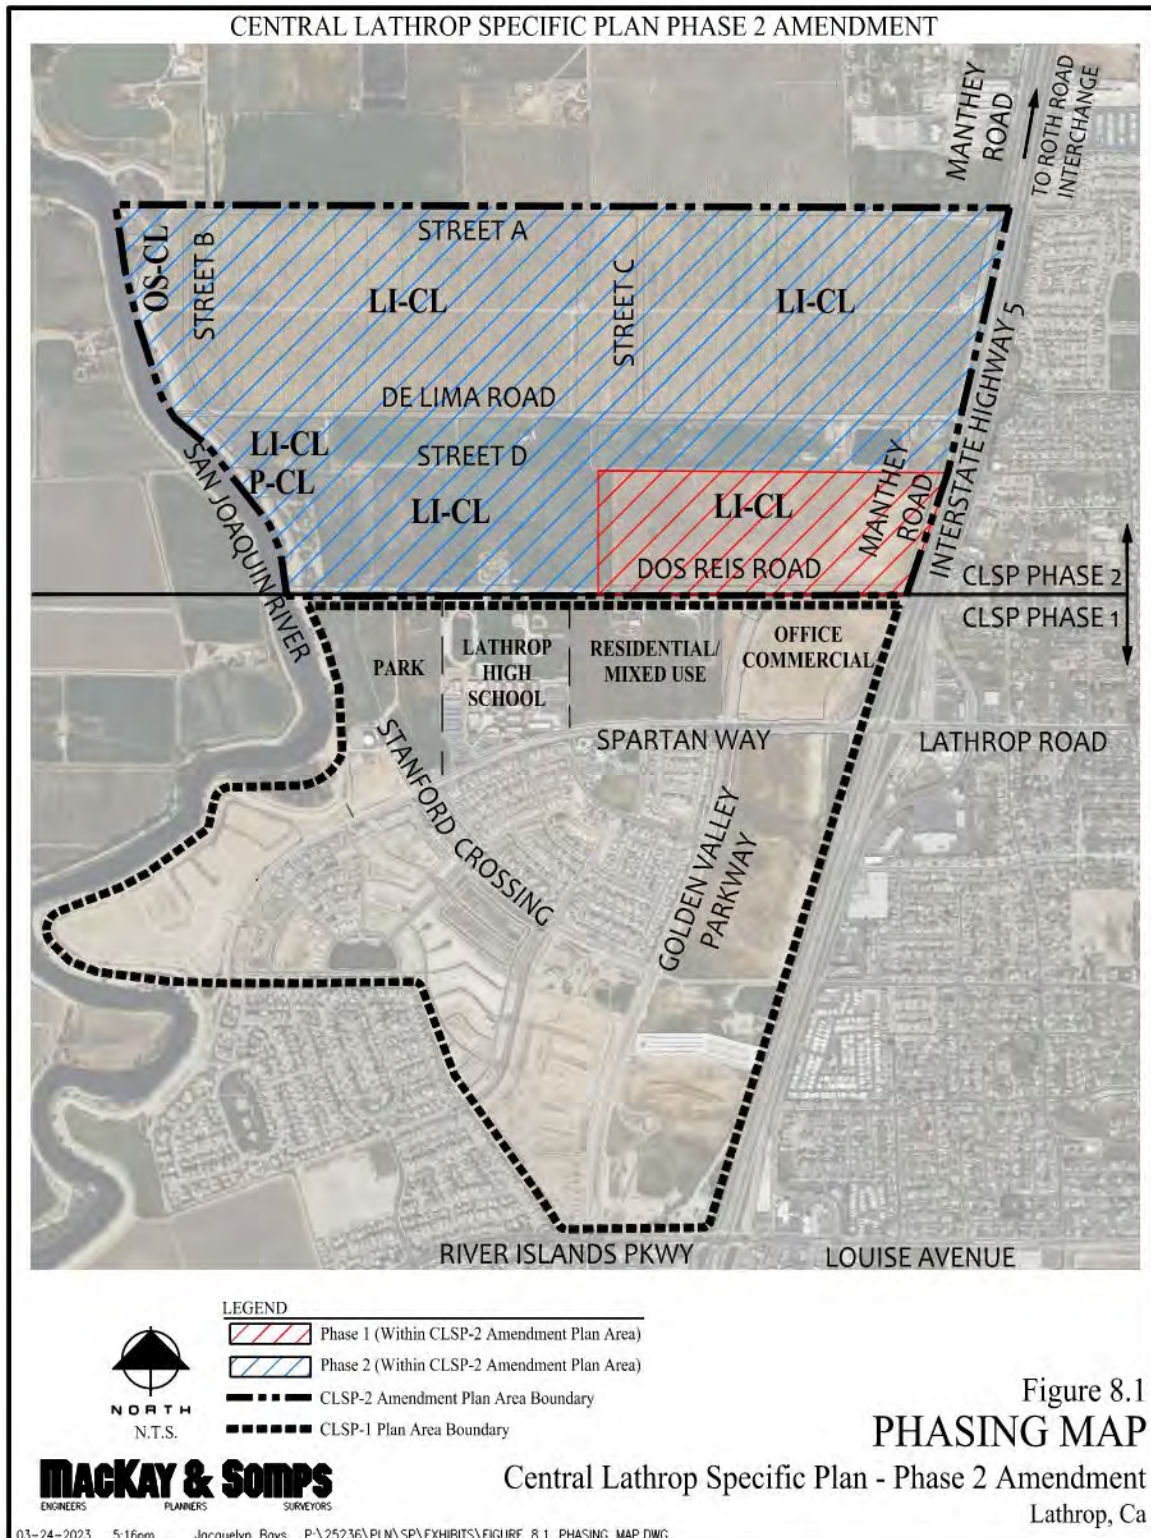

A developer may request either changes to the initial infrastructure phasing plan shown in Figure 8.1 or the establishment of sub phases. Changes to the initial infrastructure phasing plan or the establishment of sub phases are explicitly allowed without amendment to the CLSP-2 provided a developer demonstrates, to the satisfaction of the Public Works Director and Community Development Director, that infrastructure improvements necessary to adequately serve the phased development will be provided in a timely manner and will be sufficient if no further development occurs. For example:

- Roadways may be constructed at less than full width, or full length so long as the interim roadways are functional and safe and meet City improvement standards as determined by the Public Works Director or City Engineer;
- Certain segments of the water and/or recycled water systems may be deferred until needed to serve a particular phase or sub phase so long as adequate looping and pressure are provided as determined by the Public Works Director or City Engineer.;
- As it relates to stormwater runoff from individual developments, interim drainage solutions, such as temporary retention basins may be employed until off-site facilities (i.e., permanent detention pipes, pump stations, force mains and/or outfall structures) are

complete so long as a demonstration is made, to the satisfaction of the Public Works Director or City Engineer, showing that an interim alternate solution can be constructed, and that flooding will not occur. Projects shall comply with NPDES standards.

A developer may also request that changes be made to the backbone infrastructure required to serve the CLSP-2 (as such infrastructure requirements are set forth in Chapter Six) in order to respond to changing conditions of development or the availability of new technologies to address the infrastructure needs created by development. Such changes in the backbone infrastructure plan are explicitly allowed without amendment to the CLSP-2 provided a developer demonstrates, to the satisfaction of the Public Works Director and Community Development Director, that the proposed changes meet certain performance or level of service standards prescribed in the project development agreements or, where applicable performance or level of service standards are not prescribed, results in a level of service that is at least comparable to the level of service that would have been provided had the changes not been proposed.

Figure 8.1- Phasing Map

**Capital Improvement and Operation/
Maintenance Responsibilities**

The responsibilities for capital improvement provisions and ongoing operation and maintenance of public facilities and services are another important element of the overall CLSP-2 implementation program. The City is to

operate and maintain all public facilities in the CLSP-2 with the exception of those operated and maintained by special service providers, such as the reclamation district maintaining the levees. Refer to Table 8.3 for a matrix identifying the types of capital improvements and who is responsible for the associated operation/maintenance.

Table 8.1: Capital Improvement and Operation/Maintenance Responsibilities

Capital Improvement	Capital Improvement Responsibility	Operation and Maintenance Responsibility
On-site streets, alleys, and shared driveways (within CLSP-2 boundary)	Developer Individual Property Owner	City for public streets Owners Association for private streets
Off-site streets (outside of the CLSP-2 boundary)	Developer (fair share as identified in Capital Facility Fee program)	City or other public agency
Potable Water Distribution Facilities	Developer Individual Property Owner	City
Potable Surface Water Supply	South San Joaquin Irrigation District City	City
Potable Surface Water Treatment and Transmission Facilities	South San Joaquin Irrigation District City	City
Potable Groundwater Supply	Developer City	City
Potable Groundwater Treatment Facilities	Developer City	City
Wastewater Collection Facilities, including pump station(s)	Developer Individual Property Owner	City
Wastewater Treatment Facilities	City	City
Recycled Water Distribution Facilities	Developer City	City
Storm Drainage (includes all facilities including pipes, pumps, and basins)	Developer Individual Property Owner	City
Dry Utilities (electric, gas, communications)	Utility Companies Developer Individual Property Owner	Utility Companies
Public Parks and Open Space, including trails and public rights-of-way landscaping.	City[1] Developer Individual Property Owner	City or other Public entity
Fire Station and Equipment	Lathrop-Manteca Fire District	Lathrop-Manteca Fire District
Police Station and Equipment	City	City
Levee and related easements	Reclamation District 17	Reclamation District 17

[1] The potential trail along the levee adjacent open space shown on Figure 3.10 will be funded by a capital improvement fee program and constructed by the City.

Interpretation of Specific Plan

Amendments to the Specific Plan, including the Design Guidelines, may be proposed by a developer or property owner or initiated by the City, and shall be processed in accordance with the provisions described in this chapter.

Two of the primary objectives of the Central Lathrop Specific Plan-2 Amendment are:

- to maintain flexibility and the ability of the City and property owners to react quickly to changes in the marketplace, and

- to ensure, to the extent reasonably possible, the ultimate development of the CLSP-2 Amendment at the overall level of intensity of land use assumed in the CLSP-2 Amendment as approved.

The latter objective is intended to ensure the recovery of infrastructure investments made in reliance on such assumed intensities and densities. To achieve these two objectives, the City intends that the CLSP-2 Amendment be interpreted and applied with as much flexibility and creativity as is permissible within the reasonable scope of the language of the CLSP-2 Amendment. Where these two objectives can be achieved through the reasonable interpretation of the CLSP-2 Amendment, rather than through formal amendment, such interpretations is desirable and favorable over amendment. Accordingly, formal amendments shall not be necessary where a specific development proposal is in “substantial conformity” with the CLSP-2 Amendment.

The Community Development Director may determine that a specific development proposal is in substantial conformity with the CLSP-2 Amendment, where, considering all aspects of the proposal, the he/she determines that the proposal will further the objectives and policies of the CLSP-2 Amendment and not obstruct their attainment. Such as proposal need not be in perfect conformity with each and very provision of the CLSP-2 Amendment policy, provided it is consistent with the intent and basic objectives, policies, general land uses, and programs specified in the CLSP-2 Amendment. Where the Community Development Director determines that a particular development proposal is not in substantial conformity with the CLSP-2 Amendment, the land owner making the proposal has the right to appeal that determination to the Planning Commission and, if necessary, to the City Council.

The following general categories of proposals shall necessarily be determined to be in substantial conformity with the CLSP-2 Amendment, being:

- those proposals by which a developer or land owner, in response to changing conditions of development or the availability of new technologies, proposes to modify the initially-approved phasing plan provided by a developer demonstrates, to the satisfaction of the Public Works Director and the Community Development Director, that the infrastructure improvements necessary to adequately serve the developing portion of the site will be provided in a timely manner. Such proposals shall be deemed to be in substantial conformity with the CLSP-2 Amendment.
- those by which a developer or land owner seeks to modify trail alignments, fence locations or types, or similar CLSP-2 Amendment features in common areas such as parks, trails, and other public amenities. Such proposal shall be deemed to be in substantial conformity with the CLSP-2 Amendment unless the proposal is fundamentally inconsistent with the development patterns envisioned in the CLSP-2 Amendment in terms of the general locations of public amenities, trail locations and alignments, and other private land uses.
- those by which a developer or land owner seeks to add new architectural styles or planning concepts to the Design Guidelines. Such proposal might include, but not necessarily be limited to, changes in permitted building materials or detailing, additional design styles, changes to plant palettes, and different entry concepts. Proposal for such new architectural styles or planning concepts shall be accompanied by a written description of the style, a schematic drawing, and an illustration of architectural or planning elements that

typify the proposed style or concept. Such proposal shall be deemed to be in substantial conformity with the CLSP-2 Amendment unless the new architectural style or planning concept is fundamentally inconsistent with the aesthetic vision embodied in the original Design Guidelines.

Specific Plan Consistency and Enforcement

Any violation of the requirements of the CLSP-2 Amendment as adopted by the City Council shall be enforced in the same manner as a violation of the Municipal Code.

Chapter Nine: Financing

Introduction

Development in the CLSP-2 Amendment Plan Area is to be constructed and maintained through a combination of financing mechanisms. This chapter describes a preliminary Financing Plan and identifies various financing options that may be utilized to implement the CLSP-2 Amendment.

Financing Plan

The funding mechanisms for improvements within CLSP-2 Amendment Plan Area may include development impact fees and fee credits, private financing and reimbursements, Mello-Roos community facilities and assessment districts, and other public and private strategies.

Once City staff, the Developer(s), and other public entities agree upon specific improvements and facilities that need to be constructed in the CLSP-2 Amendment Plan Area, appropriate funding mechanisms will be identified for each individual improvement and facility.

The following principles shall govern the implementation of the Financing Plan unless otherwise stated in an applicable Development Agreement:

Principle 1 — New development in the CLSP-2 Plan Area shall be required to pay its own way. There shall be no cost to the City’s existing residents for facilities or services necessary to serve the CLSP-2 Amendment Plan Area. All costs of municipal services related to the CLSP-2, be they on-site or off-site, shall be borne by the individual development.

Principle 2 — The City will consider the establishment of appropriate public financing mechanisms to help finance the initial development and ongoing maintenance of

backbone infrastructure, community facilities, and public services in the CLSP-2 Amendment Plan Area. These mechanisms include but are not limited to:

- Community Facilities Districts, Assessment Districts, Benefit Districts, Infrastructure Financing Districts, and Joint Powers Arrangements for capital construction.
- Lighting and Landscape Districts, Community Facilities Districts, other maintenance assessment districts, and/or user charges for ongoing operation and maintenance purposes.

Principle 3 — The City may enter into a Joint Powers Agreement with the County, State, or any other appropriate governmental agencies that facilitates the financing of infrastructure improvements.

Principle 4 — The City shall establish appropriate reimbursement mechanisms in the event that the CLSP-2 Amendment Plan Area is required to pay for oversizing of backbone infrastructure or public facilities beyond its fair share to the benefit of existing or other new development in the City.

Principle 5 — The City shall consider implementing funding and reimbursement mechanisms to help facilitate the fair allocation of backbone infrastructure and public facilities construction costs among the various landowners in the CLSP-2 Amendment Plan Area.

Principle 6 — The City will reasonably assist developers in the CLSP-2 Amendment Plan Area in obtaining public financing for construction of both on- and off- site public improvements.

Principle 7 — The City may help fund public improvements such as the levee adjacent open

space benefiting the entire population of the City. These improvements may be supplemented by including them in the Capital Improvement Fee Program.

Updates of Financing Plan

Updates of the Financing Plan shall occur as significant new information becomes available regarding backbone infrastructure and public facilities cost estimates, land uses, and funding strategies. An administration-and-monitoring process shall be established to provide for implementation and updating of the Financing Plan.

Financing/Fiscal Measures

Various financing measures could be utilized to implement both the development and the operation and maintenance of backbone infrastructure, public facilities, and community services.

Before the recordation of any tentative tract map within the boundaries of the CLSP-2, appropriate financing mechanisms will be established to ensure adequate funding of capital improvements is available at the time when the improvements need to be constructed. Payment schedules and sources of funds for the repayment of any proposed debt will be identified for each such mechanism.

Ongoing special tax and/or assessment revenues are to be earmarked to fund operations and services in the CLSP-2 Amendment Plan Area. The level of public facilities and services in the CLSP-2 Amendment Plan Area are to be of the same or higher quality as presently being provided elsewhere in the City. Such ongoing operational concerns would include police and fire services, park and road maintenance, and other municipal services generally provided in a city.

The various mechanisms that may be used to implement the development and the operation and maintenance of backbone infrastructure, public

facilities, and community services include, but are not limited to:

Infrastructure Financing Districts

An Infrastructure Financing District (IFD) allocates a portion of new property taxes to pay for capital improvements. Essentially, when tax increment financing is utilized, subsequent increases in tax revenues are set aside for the use of the financing district. A requirement of an IFD is that it is used only in areas that are substantially underdeveloped. Formation of an IFD and issuance of bonds is contingent upon the two-thirds approval of the registered voters or property owners in the area.

Facilities eligible per Government Code section 53395.3 for financing through an IFD include the following facilities:

- Highway interchanges, bridges, arterial streets, parking facilities and transit facilities
- Sewage treatment and water reclamation plants and interceptor lines
- Water collection and treatment facilities for urban use
- Flood control structures
- Child care facilities
- Libraries
- Parks, recreational facilities and open space
- Solid waste transfer and disposal facilities.

Capital Facilities Fees

A range of Capital Facilities Fees (CFF) has been established in the City of Lathrop. for funding of sewer, drainage, environmental mitigation, transportation, culture and leisure, and municipal service facilities. Some of the backbone infrastructure and public facility improvements that need to be constructed in the CLSP-2 area fall into the CFF category.

Special Taxes

Special taxes typically are generated through formation of Mello Roos Community Facilities Districts or other similar mechanisms. Formation of Mello Roos Districts require approval by two-thirds of the property owners or the electorate within the proposed district boundary if there are twelve or more registered resident voters. The special taxes generated from Mello Roos Districts may be used to pay for purchase, construction, expansion, improvement, operations and maintenance, or rehabilitation of real property with a useful life of five years or more. Alternatively, the special taxes can be used to fund the debt service for bonds that have been issued for financing of such improvements.

Special Assessments

Most of the special assessment acts provide for the issuance of bonds. These bonds generally are secured by the property in the district, and the bonded indebtedness is repaid with the money generated through the assessments. Some of the most common types of special assessments are outlined in the Improvement Act of 1911, the Municipal Improvement Act of 1913, and the Improvement Bond Act of 1915.

Landscape and Lighting Districts

The most commonly known and widely used special assessment is a Landscape and Lighting District, enabled by the Landscape and Lighting Act of 1972 (Streets and Highways Code Section 22500 *et seq.*). A Landscape and Lighting District may be formed to assist in funding of the ongoing

operation and maintenance of street rights of ways and other public improvements.

General Obligation Bonds

In 1986, with the passage of Proposition 46, cities and counties were empowered with the right to issue general obligation bonds. General obligation bonds, which are repaid with revenues from increased property taxes, may be used to finance land acquisition and construction of capital improvements. A general obligation bond requires a two-thirds voter approval.

Revenue Bonds

Cities, counties, and some special districts can issue bonds to finance facilities for revenue-producing enterprises such as water and sewer improvements, golf courses, harbors, etc. The bonds are repaid solely from the revenues generated by the financed facility. Revenue bond issuance may require voter authorization.

Plan Area Development Impact Fees

Generally paid at the time of building permit, development impact fees may be charged for construction of facilities benefiting the affected area. A nexus study is required to justify the imposition of the plan area development impact fees. The City can adopt the fees through approval of an ordinance and/or resolution.

Third Party Assistance

Some costs may be eligible for outside financing assistance. For example, schools and libraries may be partially financed by state contributions.

Private Developer Financing

In addition to the use of public financing mechanisms, private developers in the CLSP will be required to pay for a significant portion of the backbone infrastructure and public facilities development costs.

Financing of Ongoing Operation and Maintenance

Financing of ongoing operation and maintenance of the public facilities and services is another important element of the overall financing program for the CLSP. The City is to operate and maintain all public facilities in the CLSP with the exception of those operated and maintained by special service providers. For example, the reclamation district maintains levees.

A Landscape and Lighting District or a Mello Roos CFD Services District may be formed to assist in funding of the ongoing operation and maintenance of street rights of ways and other components.

A detailed operation and maintenance budget is to be developed for each public facility and service prior to the recordation of the first tentative tract map in the CLSP-2. The budget will identify the appropriate sources of funds and the agencies responsible for maintenance and operation of the facilities and services.

The City intends to utilize a variety of financing measures for operation and maintenance. These measures include but are not limited to:

Property Taxes

The City receives a portion of the 1-percent property tax paid by all residential and commercial property owners within the City limits. As the CLSP develops, the incremental property tax is to be used to pay for the services required by new residents. In addition, existing special districts, like the Lathrop-Manteca Fire District, that also receive a direct allocation of the 1-percent property tax, will use the incremental taxes to provide required services. Property taxes are likely to be the primary funding source for operation and maintenance of the special districts.

Sales Taxes

Retail establishments in the CLSP-2 Amendment Plan Area generate sales tax revenues for the City. These taxes, of which the City receives a large portion, are to be used by the City to pay for services provided to its new and existing residents.

User Fees

Primarily charged by utility providers, user fees may be charged to pay for the cost of services. For example, the City, through its Public Works Department, will determine and assess a user fee for water and sewer services in the CLSP-2 Amendment Plan Area.

Regional Transportation Fees

In 1990, San Joaquin voters passed the Measure K Ordinance and Expenditure Plan (Measure K), which establishes and implements a 1/2-cent sales tax for transportation purposes up to year 2011. Measure K provides for the implementation of the San Joaquin Expenditure Plan, resulting in countywide transportation facility and service improvements including highway, public transit, railroad grade crossing, and passenger rail improvements.

In addition, the San Joaquin Council Governments, the regional planning agency for San Joaquin County, established a countywide regional transportation impact fee (RTIF). Mitigation Fees

Payment of fees may be required to mitigate the impact(s) that the development of the CLSP-2 has on the environment and existing development.

Special Assessments

Special assessments may be charged to the CLSP-2 Amendment users to pay for operation and maintenance of public infrastructure. Special assessments cannot exceed the cost of providing services and are limited to special benefit properties subject to the assessment received. The most commonly known and widely used special assessment is a Landscape and Lighting District, enabled by the Landscape and Lighting Act of 1972 (Streets and Highways Code Section 22500 et seq.).

Special Taxes

Mello Roos Community Facilities Districts (CFD) also allow for collection of special taxes to fund

operations and maintenance of facilities built or financed with CFD bond proceeds. The operations and maintenance costs funded by the special taxes have to be new costs associated with the new development. The special taxes cannot be used to replace general fund revenues.

Dedications and Exactions

Under the Subdivision Map Act, developers may be required to dedicate land or make cash payments for public facilities required or affected by their project (e.g., road right-of-way fronting individual properties). Dedications are typically made for road and utility rights-of-way, park sites, and land for other public facilities. Cash contributions are made for other public facilities that are directly required by their projects (e.g., payments for a traffic signal).

Development Agreements

The City and developers in the CLSP-2 may enter into development agreements. These agreements outline responsibilities for financing and construction of backbone infrastructure and public facilities, as well as for funding of ongoing operations and maintenance of the facilities and services in the CLSP-2 Amendment Plan Area. The City may design and build the required infrastructure and public facilities and fund the construction through collection of development impact fees, issuance of bonds, or any other appropriate financing mechanism. If a developer is required to design and build the improvements, fee credits and acquisition agreements with the City or other public agencies may be utilized along with issuance of bonds, private financing, and other funding mechanisms.

Federal and State Grants

The City has in the past received funding for public facilities from other levels of government, including the State and federal government. Historically, these funding sources were more available; however, several sources of grant funding still remain and several new programs have

recently been established. Further investigation of potential funding sources is appropriate. However, since the availability of funding from these sources is unknown, it has not been assumed that these sources would be available for development financing.

An example would be the EIFD for funding 200-year flood control improvements for the Fix in Place Project.

Reimbursement Agreements

Each benefiting property in the CLSP-2 Amendment Plan Area is required to pay its fair share of the backbone infrastructure and public facilities construction, maintenance, and land acquisition costs. To the extent a developer or landowner may be required to dedicate land for public purpose; fund the acquisition, construction, or operation and maintenance, or otherwise contribute to the provision of public facilities and/or services (including the oversizing of such facilities); finance the preparation of this Specific Plan amendment and the processing of the related entitlements including annexation; or incur costs related to the legal defense of such entitlements in excess of his or her fair share to the benefit of other properties, a reimbursement mechanism shall be executed to ensure a fair-share cost allocation among all properties. The reimbursement mechanism can be in the form of a benefit or another type of a financing district, a private or public reimbursement agreement, and/or any other appropriate arrangement that can guarantee a fair allocation of costs.

A fair share cost allocation shall be implemented through the Financing Plan for on- and off-site improvements, based on net costs after accounting for any Federal, State, regional, or other public funding that may have been obtained.

INTRODUCTION

The Ashley Lathrop Project is located in the City of Lathrop, California. The project will consist of a 1,486,607 s.f. multi-use building that will contain 24,000 s.f. of office space, 110,260 s.f. of retail space, and a 1,352,347 s.f. warehouse space containing a parking lot with 942 stalls for automobiles, 1,104 stalls for trucks, and 237 loading docks. The primary noise source associated with operation of the project is truck and automobile circulation and loading docks. Single family residential land uses are located to the north, west, and south of the project, Lathrop High School is located to the west of the project, and Interstate 5 (I-5) is located directly east of the project. The project is located northwest of the intersection of South Manthey Road and Dos Reis Road. The purpose of this analysis is to predict the noise generation associated with these uses and to achieve compliance with the applicable City of Lathrop noise level standards.

Figure 1 shows the project site plan. **Figure 2** shows an aerial photo of the project site and noise measurement locations.

ENVIRONMENTAL SETTING

BACKGROUND INFORMATION ON NOISE

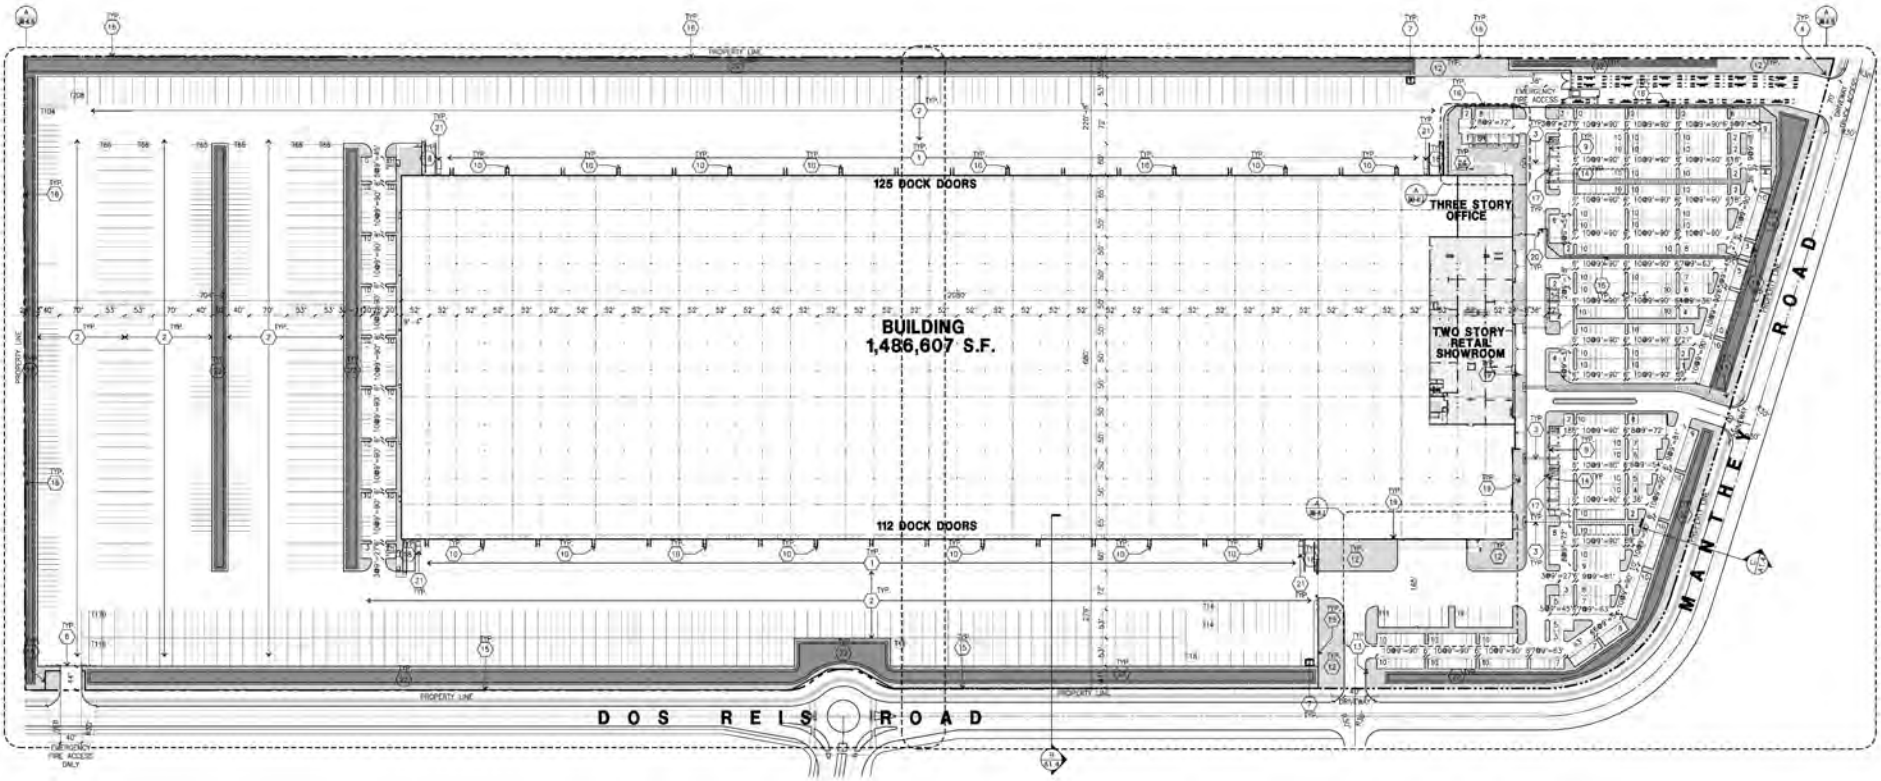

Fundamentals of Acoustics

Acoustics is the science of sound. Sound may be thought of as mechanical energy of a vibrating object transmitted by pressure waves through a medium to human (or animal) ears. If the pressure variations occur frequently enough (at least 20 times per second), then they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound, and is expressed as cycles per second or Hertz (Hz).

Noise is a subjective reaction to different types of sounds. Noise is typically defined as (airborne) sound that is loud, unpleasant, unexpected or undesired, and may therefore be classified as a more specific group of sounds. Perceptions of sound and noise are highly subjective from person to person.

Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the hearing threshold (20 micropascals), as a point of reference, defined as 0 dB. Other sound pressures are then compared to this reference pressure, and the logarithm is taken to keep the numbers in a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB, and changes in levels (dB) correspond closely to human perception of relative loudness.

The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by A-weighted sound levels. There is a strong correlation between A-weighted sound levels (expressed as dBA) and the way the human ear perceives sound. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. All noise levels reported in this section are in terms of A-weighted levels, but are expressed as dB, unless otherwise noted.

-  Noise Measurement Site - Long Term

Projection: UTM Zone 10 / WGS84 / meters
Rev. Date: 10/13/2022

The decibel scale is logarithmic, not linear. In other words, two sound levels 10-dB apart differ in acoustic energy by a factor of 10. When the standard logarithmic decibel is A-weighted, an increase of 10-dBA is generally perceived as a doubling in loudness. For example, a 70-dBA sound is half as loud as an 80-dBA sound, and twice as loud as a 60 dBA sound.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given environment. A common statistical tool is the average, or equivalent, sound level (L_{eq}), which corresponds to a steady-state A weighted sound level containing the same total energy as a time varying signal over a given time period (usually one hour). The L_{eq} is the foundation of the composite noise descriptor, L_{dn} , and shows very good correlation with community response to noise.

The day/night average level (L_{dn}) is based upon the average noise level over a 24-hour day, with a +10-decibel weighing applied to noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because L_{dn} represents a 24-hour average, it tends to disguise short-term variations in the noise environment.

Table 1 lists several examples of the noise levels associated with common situations. **Appendix A** provides a summary of acoustical terms used in this report.

TABLE 1: TYPICAL NOISE LEVELS

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	--110--	Rock Band
Jet Fly-over at 300 m (1,000 ft.)	--100--	
Gas Lawn Mower at 1 m (3 ft.)	--90--	
Diesel Truck at 15 m (50 ft.), at 80 km/hr. (50 mph)	--80--	Food Blender at 1 m (3 ft.) Garbage Disposal at 1 m (3 ft.)
Noisy Urban Area, Daytime Gas Lawn Mower, 30 m (100 ft.)	--70--	Vacuum Cleaner at 3 m (10 ft.)
Commercial Area Heavy Traffic at 90 m (300 ft.)	--60--	Normal Speech at 1 m (3 ft.)
Quiet Urban Daytime	--50--	Large Business Office Dishwasher in Next Room
Quiet Urban Nighttime	--40--	Theater, Large Conference Room (Background)
Quiet Suburban Nighttime	--30--	Library
Quiet Rural Nighttime	--20--	Bedroom at Night, Concert Hall (Background)
	--10--	Broadcast/Recording Studio
Lowest Threshold of Human Hearing	--0--	Lowest Threshold of Human Hearing

Effects of Noise on People

The effects of noise on people can be placed in three categories:

- Subjective effects of annoyance, nuisance, and dissatisfaction
- Interference with activities such as speech, sleep, and learning
- Physiological effects such as hearing loss or sudden startling

Environmental noise typically produces effects in the first two categories. Workers in industrial plants can experience noise in the last category. There is no completely satisfactory way to measure the subjective effects of noise or the corresponding reactions of annoyance and dissatisfaction. A wide variation in individual thresholds of annoyance exists and different tolerances to noise tend to develop based on an individual's past experiences with noise.

Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted: the so-called ambient noise level. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will be judged by those hearing it.

With regard to increases in A-weighted noise level, the following relationships occur:

- Except in carefully controlled laboratory experiments, a change of 1-dBA cannot be perceived;
- Outside of the laboratory, a 3-dBA change is considered a just-perceivable difference;
- A change in level of at least 5-dBA is required before any noticeable change in human response would be expected; and
- A 10-dBA change is subjectively heard as approximately a doubling in loudness, and can cause an adverse response.

Stationary point sources of noise – including stationary mobile sources such as idling vehicles – attenuate (lessen) at a rate of approximately 6-dB per doubling of distance from the source, depending on environmental conditions (i.e. atmospheric conditions and either vegetative or manufactured noise barriers, etc.). Widely distributed noises, such as a large industrial facility spread over many acres, or a street with moving vehicles, would typically attenuate at a lower rate.

EXISTING AMBIENT NOISE LEVELS

To quantify the existing ambient noise environment in the project vicinity, Saxelby Acoustics conducted continuous (24-hr.) noise level measurements at two locations near the project site. Noise measurement locations are shown on **Figure 2**. A summary of the noise level measurement survey results is provided in **Table 2**. **Appendix B** contains the complete results of the noise monitoring.

The sound level meters were programmed to record the maximum, median, and average noise levels at each site during the survey. The maximum value, denoted L_{max} , represents the highest noise level measured. The average value, denoted L_{eq} , represents the energy average of all of the noise received by the sound level meter microphone during the monitoring period. The median value, denoted L_{50} , represents the sound level exceeded 50 percent of the time during the monitoring period.

Larson Davis Laboratories (LDL) model 820 integrating sound level meters were used for the ambient noise level measurement survey. The meters were calibrated before and after use with a CAL 200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute for Type 1 sound level meters (ANSI S1.4).

Table 2: Summary of Existing Background Noise Measurement Data

REGULATORY CONTEXT

FEDERAL

There are no federal regulations related to noise that apply to the Proposed Project.

STATE

There are no state regulations related to noise that apply to the Proposed Project.

LOCAL

City of Lathrop General Plan

N-1 POLICIES

N-1.3 Indoor Residential Noise Level. Ensure that new development does not result in indoor noise levels exceeding 45 dBA L_{dn} for residential uses by requiring the implementation of construction techniques and noise reduction measures for all new residential development.

N-1.4 Acoustical Studies. For projects that are required to prepare an acoustical study, the following stationary and transportation noise source criteria shall be used to determine the significance of those impacts.

A. Stationary and Non-Transportation Noise Sources – A significant impact will occur if the project results in an exceedance of the noise level standards contained in this element, or the project will result in an increase in ambient noise levels by more than 3 dB, whichever is greater.

B. Transportation Noise Sources -

1. Where existing traffic noise levels are less than 60 dB L_{dn} at the outdoor activity areas of noise-sensitive uses, a +5 dB L_{dn} increase in roadway noise levels will be considered significant;
2. Where existing traffic noise levels range between 60 and 65 dB L_{dn} at the outdoor activity areas of noise-sensitive uses, a +3 dB L_{dn} increase in roadway noise levels will be considered significant; and
3. Where existing traffic noise levels are greater than 65 dB L_{dn} at the outdoor activity areas of noise-sensitive uses, a + 1.5 dB L_{dn} increase in roadway noise levels will be considered significant.

N-1.15 Construction Noise. Require construction activities to reduce noise impacts on adjacent uses to the criteria identified in Table N-3, or, if the criteria cannot be met, to the maximum extent feasible complying with Title 15 of the LMC (Building and Construction) and use best practices. Construction activities outside of the permitted construction hours identified in the LMC may be approved on a case by case basis by the Building Official.

TABLE 3: PERFORMANCE STANDARDS FOR STATIONARY NOISE SOURCES, INCLUDING AFFECTED PROJECTS ^{1,2,3,4} (N-3)

Noise Level Descriptor	Daytime (7 am to 10 pm)	Nighttime (10 pm to 7 am)
Hourly Leq, dB	55	45

1. Each of the noise levels specified above should be lowered by 5 dB for simple noise tones, noises consisting primarily of speech or music, or recurring impulsive noises. Such noises are generally considered to be particularly annoying and are a primary source of noise complaints.
2. No standards have been included for interior noise levels. Standard construction practices should, with the exterior noise levels identified, result in acceptable interior noise levels.
3. Stationary noise sources which are typically of concern include, but are not limited to, the following:

a) HVAC Systems	b) Cooling Towers/Evaporative Condensers
c) Pump Stations	d) Lift Stations
e) Emergency	f) Boilers
g) Steam Valves	h) Steam Turbines
i) Generators	j) Fans
k) Air Compressors	l) Heavy Equipment
m) Conveyor Systems	n) Transformers
o) Pile Drives	p) Grinder
q) Drill Rigs	r) Gas or Diesel Motors
s) Welders	t) Cutting Equipment
u) Outdoor Speaker	v) Blowers
4. The types of uses which may typically produce the noise sources described above include but are not limited to: industrial facilities, pump stations, trucking operations, tire shops, auto maintenance shops, metal fabricating shops, shopping centers, drive-up windows, car washes, loading docks, public works projects, batch plants, bottling and canning plants, recycling centers, electric generating stations, race tracks, landfills, sand and gravel operations, and athletic fields.

EVALUATION OF PROJECT OPERATIONAL NOISE ON EXISTING SENSITIVE RECEPTORS

MODELING METHODOLOGY

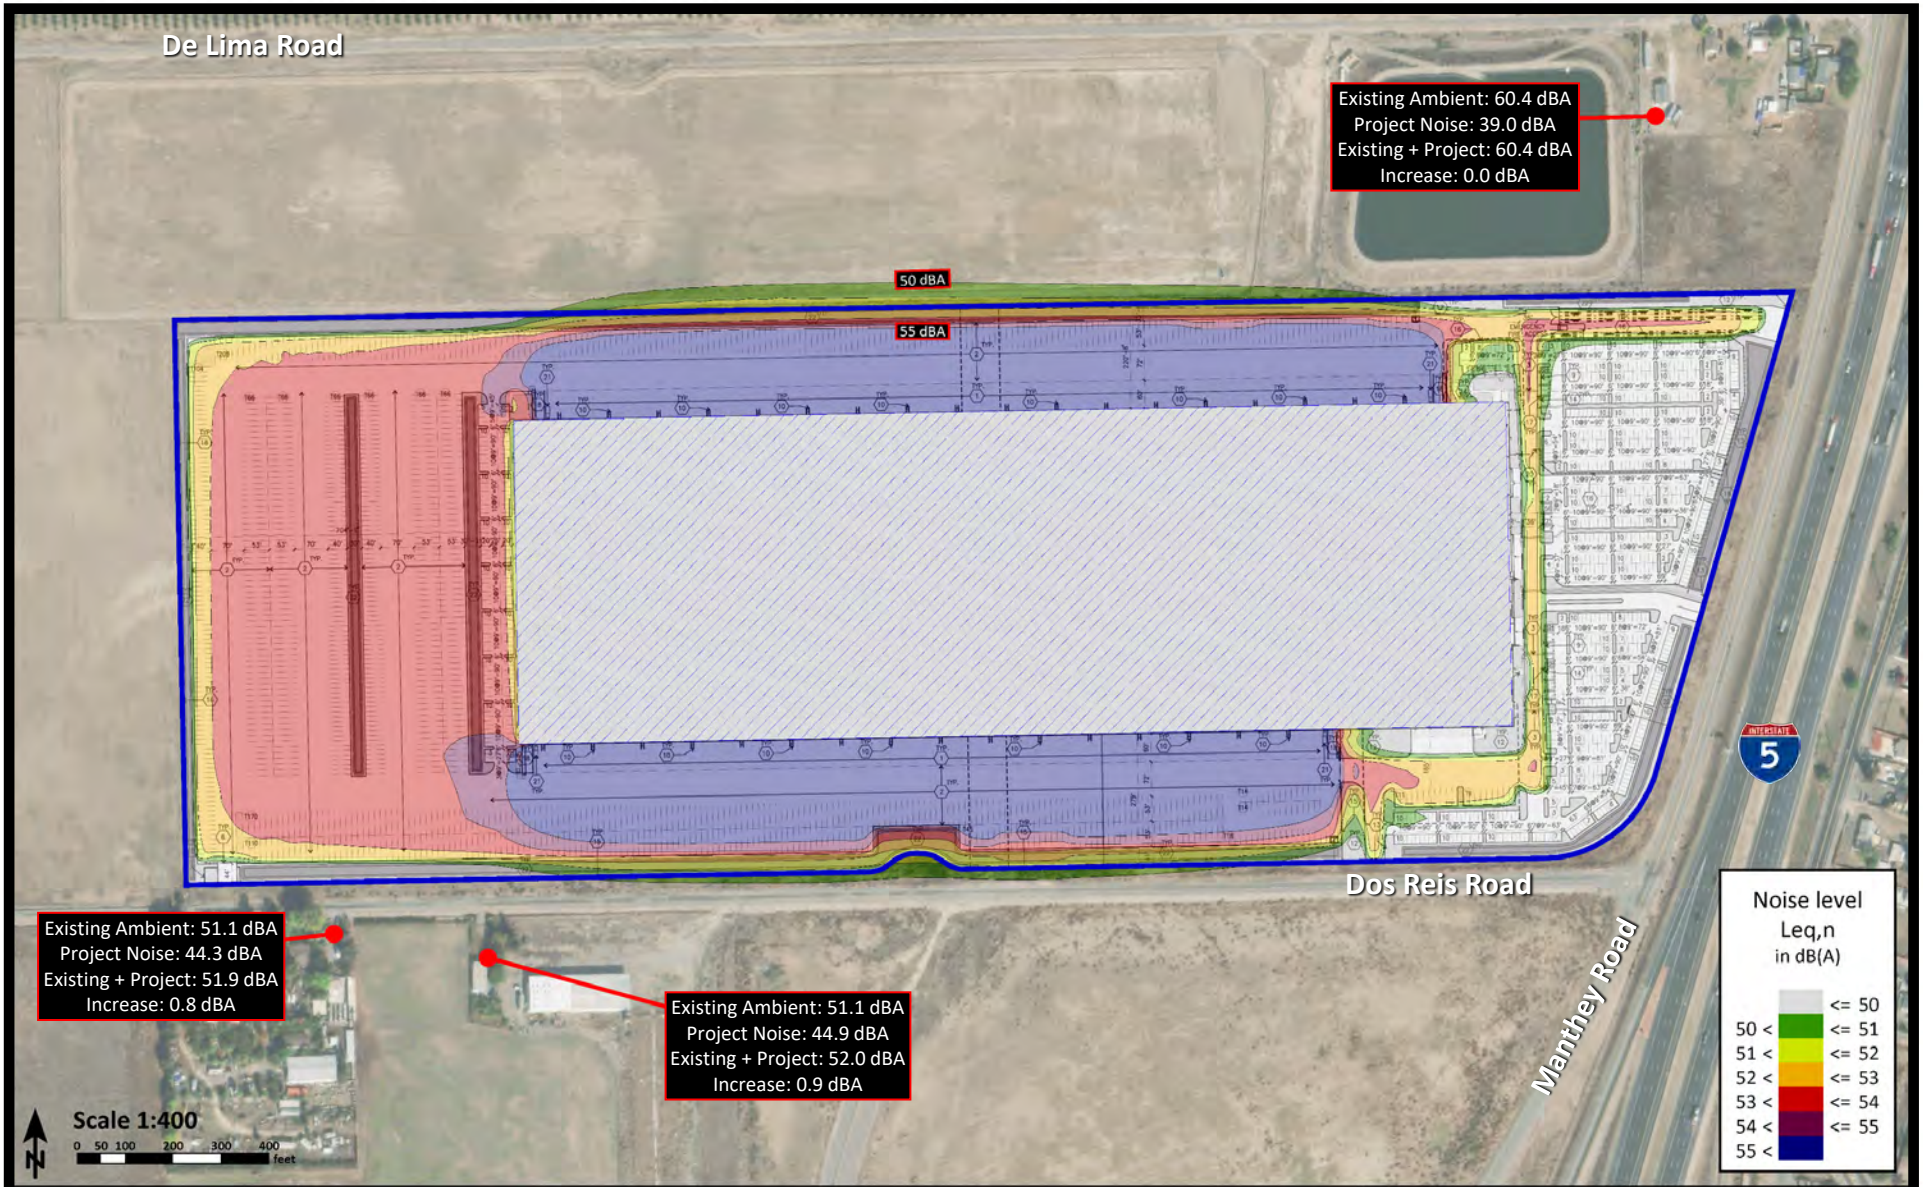

The primary noise source on the proposed project site would be operation noise from the loading docks and vehicle circulation on site. The following is a list of assumptions used for the noise modeling. The data used is based upon Saxelby Acoustics data from similar operations.

On-Site Circulation: The proposed project is projected to generate 2,798 daily automobile trips with 203 trips in the morning peak hour and 680 daily heavy truck trips with 95 trips in the morning peak hour (TJKM). Parking lot movements are predicted to generate a sound exposure level (SEL) of 71 dBA SEL at 50 feet for cars and 85 dBA SEL at 50 feet for trucks. It was assumed that the morning peak hour could occur during nighttime (10:00 p.m. to 7:00 a.m.) hours. Saxelby Acoustics data.

Loading Docks: Saxelby Acoustics conducted noise level measurements at the existing Ashley Facility located at 18290 S Harlan Road in Lathrop, California. Measurements were conducted of the loading dock area during a weekday peak hour of use. Activities during the peak hour include truck arrival/departures, truck idling, truck backing, air brake release, passenger vehicle trips to and from docks, and

operation of forklifts. Loading dock activity was found to generate continuous average noise levels of approximately 57 dBA L_{eq} at the edge of the truck maneuvering lanes, approximately 120 feet from the façade of the warehouse building at the center of the loading area. Loading dock activity was assumed to operate at this level continuously during nighttime (10:00 p.m. to 7:00 a.m.) hours. Saxelby Acoustics data.

Saxelby Acoustics used the SoundPLAN noise prediction model. Inputs to the model included sound power levels for the proposed equipment, existing and proposed buildings, terrain type, and locations of sensitive receptors. These predictions are made in accordance with International Organization for Standardization (ISO) standard 9613-2:1996 (Acoustics – Attenuation of sound during propagation outdoors). ISO 9613 is the most commonly used method for calculating exterior noise propagation. **Figure 3** shows the noise level contours resulting from operation of the project.

Ashley Lathrop Warehouse

City of Lathrop, California

Figure 3

Project-Generated Noise Levels (dBA L_{eq})

RESULTS AND ANALYSIS

The City of Lathrop General Plan limits stationary noise increases to 3 dBA, or the **Table 3** standards, whichever is greater. The nighttime (10:00 p.m. to 7:00 a.m.) average noise level standard is 45 dBA L_{eq} , as shown in **Table 3**. **Table 2** indicates that the average ambient noise level during nighttime hours at the closest sensitive receptors to the southwest is 51 dBA L_{eq} . At the sensitive receptors to the southwest, a project-generated noise level of 51 dBA L_{eq} would result in a total noise level of 54 dBA L_{eq} , resulting in a 3 dBA increase. Therefore, the nighttime noise level standard applicable to the proposed project is 51 dBA L_{eq} .

As shown in **Figure 3**, the proposed project is predicted to generate noise levels of up to 45 dBA L_{eq} at the nearest residences to the southwest and 39 dBA L_{eq} at the residences to the northeast, resulting in a maximum increase of 0.9 dBA at nearby residences. This complies with the adjusted nighttime noise level standard of 51 dBA L_{eq} and limit of a 3 dBA increase. Therefore, no additional noise control measures are required to achieve compliance with the City of Lathrop noise level standards.

CONCLUSIONS

The proposed project is predicted to comply with the City of Lathrop noise level standards with no additional noise control measures.

Appendix A: Acoustical Terminology

Acoustics	The science of sound.
Ambient Noise	The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.
ASTC	Apparent Sound Transmission Class. Similar to STC but includes sound from flanking paths and correct for room reverberation. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
Attenuation	The reduction of an acoustic signal.
A-Weighting	A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.
Decibel or dB	Fundamental unit of sound, A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.
CNEL	Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by +5 dBA and nighttime hours weighted by +10 dBA.
DNL	See definition of Ldn.
IIC	Impact Insulation Class. An integer-number rating of how well a building floor attenuates impact sounds, such as footsteps. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
Frequency	The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz (Hz).
Ldn	Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.
Leq	Equivalent or energy-averaged sound level.
Lmax	The highest root-mean-square (RMS) sound level measured over a given period of time.
L(n)	The sound level exceeded a described percentile over a measurement period. For instance, an hourly L50 is the sound level exceeded 50% of the time during the one-hour period.
Loudness	A subjective term for the sensation of the magnitude of sound.
NIC	Noise Isolation Class. A rating of the noise reduction between two spaces. Similar to STC but includes sound from flanking paths and no correction for room reverberation.
NNIC	Normalized Noise Isolation Class. Similar to NIC but includes a correction for room reverberation.
Noise	Unwanted sound.
NRC	Noise Reduction Coefficient. NRC is a single-number rating of the sound-absorption of a material equal to the arithmetic mean of the sound-absorption coefficients in the 250, 500, 1000, and 2,000 Hz octave frequency bands rounded to the nearest multiple of 0.05. It is a representation of the amount of sound energy absorbed upon striking a particular surface. An NRC of 0 indicates perfect reflection; an NRC of 1 indicates perfect absorption.
RT60	The time it takes reverberant sound to decay by 60 dB once the source has been removed.
Sabin	The unit of sound absorption. One square foot of material absorbing 100% of incident sound has an absorption of 1 Sabin.
SEL	Sound Exposure Level. SEL is a rating, in decibels, of a discrete event, such as an aircraft flyover or train pass by, that compresses the total sound energy into a one-second event.
SPC	Speech Privacy Class. SPC is a method of rating speech privacy in buildings. It is designed to measure the degree of speech privacy provided by a closed room, indicating the degree to which conversations occurring within are kept private from listeners outside the room.
STC	Sound Transmission Class. STC is an integer rating of how well a building partition attenuates airborne sound. It is widely used to rate interior partitions, ceilings/floors, doors, windows and exterior wall configurations. The STC rating is typically used to rate the sound transmission of a specific building element when tested in laboratory conditions where flanking paths around the assembly don't exist. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
Threshold of Hearing	The lowest sound that can be perceived by the human auditory system, generally considered to be 0 dB for persons with perfect hearing.
Threshold of Pain	Approximately 120 dB above the threshold of hearing.
Impulsive	Sound of short duration, usually less than one second, with an abrupt onset and rapid decay.
Simple Tone	Any sound which can be judged as audible as a single pitch or set of single pitches.

INTRODUCTION

This Health Risk Assessment (HRA) was prepared to assess potential public health risks that may be present at the proposed Lathrop Ashley Warehouse in the city of Lathrop, San Joaquin County, California. This report analyzes the emissions of toxic air pollutants within the project area and their impacts on public health.

PROJECT DESCRIPTION

PROJECT LOCATION

The Lathrop Ashley Warehouse Project site (proposed Project site) is comprised of approximately 86 acres located in the northwestern portion of the City of Lathrop, west of Interstation 5 (I-5), and adjacent to Manthey Road to the east and Dos Reis Road to the south. Figure 1 shows the Project location.

EXISTING SURROUNDING USES

The Project site is primarily bounded by rural lands, including agricultural, public, and rural residential land uses. There are several clusters of sensitive receptors within the vicinity of the Project site. Specifically, Lathrop High School is located approximately 455 feet to the west of the Project site. Additionally, residences are located at various locations surrounding the Project site. Specifically, residences are located surrounding the Project site as follows:

- A cluster of residences is located adjacent to the southwest portion of the Project site, on the opposite side of Dos Reis Road;
- Several residences are located north of and adjacent to Lathrop High School (approximately 940 feet west of the Project site);
- A rural residence is located northwest of the Project site (approximately 820 feet from the Project site);
- A cluster of residences is located north of the northeast portion of the Project site (approximately 320 feet from the Project site); as well as additional residences located along Manthey Road north of the Project site;
- A high concentration of residences is located along the opposite side of Interstate 5, east of the Project site (approximately 400 feet east and northeast of the Project site).

PROJECT CHARACTERISTICS

The Project proposes to develop the approximately 89.5-acre site to create the proposed Ashley Furniture Warehouse. The warehouse building is anticipated to have a footprint of approximately 1,486,607 square feet, with ample parking for trucks and vehicles. The Project consists of a single building, with a mix of tenant-related uses. The primary mix of uses within the Project building include an up to 100,000 square foot retail showroom, a 24,000 square foot, 2-3 story office space consisting of call center and a regional office for up to 50 people. Warehouse and distribution uses will comprise the balance of the 1,352,347 square feet. The proposed building's height is approximately 50 feet, with architectural features that may extend to approximately 60 feet. Vehicular & heavy-duty truck access to the Project site is proposed via four (4) access drives;

however, only one (1) access drive on Manthey Road at the far northeast corner is dedicated for heavy-duty truck ingress/egress onto and from the Project. Figure 2 provides a site plan.

SCOPE OF RISK ASSESSMENT

Preparation of risk assessments is a three-step process. The first step is to identify potential contaminants that may lead to public health risks. The second step is to assess the magnitude of contaminants that may reach the public (exposure assessment). The last step is to calculate the magnitude of the health risk as a result of exposure to harmful contaminants on the basis of the toxicology of the contaminants.

The Office of Environmental Health Hazard Assessment, and the San Joaquin Valley Air Pollution Control District (SJVAPCD) provide guidance on the procedures that should be used, including, toxicological data for individual contaminants. This risk assessment is based on the guidance provided within these guidance documents. It should be noted that while this risk assessment uses certain procedures and data from these Guidelines, this assessment is not intended to satisfy the reporting requirements under AB-2588 “Air Toxics” Hot Spots program.

The health risks that are evaluated in this study include:

- Residential Cancer Risk (70-year exposure; start at third trimester);
- Workplace Cancer Risk (40-year exposure; start at age 16); and
- Acute and Chronic Hazard Indices.

The 70-year risk applies to residential areas where exposure may potentially occur 24 hours/day, 365 days/year. The 40-year risk is applicable to workplace exposure and therefore accounts for a reduced exposure for the fact that individuals typically would be exposed 8-hrs per day, 5 days per week, and 50 weeks per year. Non-cancer risks can be described as acute (short-term, exposure) or chronic health impacts.

SIGNIFICANCE CRITERIA

The following significance criteria shown in Table 1, based on guidance from the SJVAPCD, are used in this report to assess the significance of public health risks.

TABLE 1 THRESHOLDS OF SIGNIFICANCE FOR PUBLIC HEALTH RISKS

<i>Risk Metric</i>	<i>Significance Threshold</i>
Residential Cancer Risk	20 per million
Workplace Cancer Risk	20 per million
Chronic and Acute non-cancer hazard Indices	non-cancer health hazard exposure index of 1.0

SOURCE: SJVAPCD, 2015.

As shown in Table 1, a project that contributes a cancer risk in excess of 20 new cases in a population of one million persons at identified receptors, or a non-cancer hazard index of greater than or equal to 1.0 would be considered to have a significant project-level impact.

EMISSION SOURCES AND EXPOSURE

The main source of toxic air pollutants (TACs) by the proposed Project is diesel particulate matter (DPM) from truck idle and mobile emissions. Based on numerous studies by the California Air Resources Board (ARB), DPM represents the largest single contributor to public health risks. Additionally, in its comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely to develop lung cancer than workers who were not exposed to diesel emissions. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

Emissions from the following project sources were analyzed and are shown in Table 2:

- Truck on-site and off-site mobile emissions
- Truck on-site idling emissions

TABLE 2: EMISSION SOURCE ASSUMPTIONS

Source Type / Emission	Configuration	Assumptions
On- and Off-site Mobile Diesel Truck Circulation (DPM)	<i>Modeled as line-volume sources</i> Release Height = 6 ft Plume Height = 12 ft Plume Width = 12 ft (width of a truck) Line Lengths = based on path of travel	<ul style="list-style-type: none"> • On-site and off-site travel of 680 trucks per day (TJKM, 2023). • Traveling distance based on proposed site plan layout and anticipated ingress/egress routes. • Both on-site and off-site mobile circulation modeled. • Off-site mobile routes modeled by approximately 0.5 miles from project site boundaries. • PM₁₀ mobile emissions factor provided by EMFAC 2021 (Parameters: San Joaquin County, Annual, Year 2022; emission factor for T7 Tractor Class 8)
On-site Diesel Truck Idling (DPM)	<i>Modeled as point sources</i> Release Height = 12 ft Diameter = 0.1 meter Velocity = 57.1 m/s @ 1500 rpm Temperature = 366 K	<ul style="list-style-type: none"> • On-site Idle of 680 trucks per day (TJKM, 2023) • 5 minutes idling per vehicle • PM₁₀ mobile emissions factor provided by CARB's EMFAC2021 idling emission factors for 2022 HHDT diesel trucks.

DAILY TRUCK TRIPS AND ROUTES

The total diesel truck trips generated by the proposed project is based on the *Ashley Warehouse Traffic Impact Analysis Report* prepared for the proposed project prepared by TJKM in July 2023. According to the *Ashley Warehouse Traffic Impact Analysis Report*, the average total daily truck traffic includes 680 heavy-duty truck trips per day. The Technical Memorandum is provided in Appendix 2.

The off-site diesel heavy-duty truck routes were modeled consistent with the trip distribution for heavy trucks as provided in Figure 10 of TJKM's *Ashley Warehouse Traffic Impact Analysis Report* (see Appendix 2 of this report for further detail), as far as approximately 0.5 miles away from the Project site (consistent with San Joaquin Valley Air Pollution Control District guidance, which recommends at least modeling off-site truck routes of at least 0.25 miles from the Project site). As shown in TJKM's *Ashley Warehouse Traffic Impact Analysis Report*, the diesel truck trips would only travel to and from the Project site via the far northeast corner of the Project site. The Project would restrict heavy-duty trucks from using the Lathrop Road/I-5 interchange at all times to alleviate potential congestion on those intersections. Instead, the heavy-duty trucks would use the Roth Road/I-5 interchange via Manthey Road to access the Project site from the ingress/egress point at the far northeast corner of the Project site. Therefore, the modeled off-site routes included the north and south routes along Manthey Road from the Project sites far northeastern ingress/egress point. The heavy-duty trucks would not utilize Lathrop Road nor directly pass Lathrop High school.

Separately, the on-site circulation of trucks was modeled to account for the diesel truck travel throughout the entirety of the internal circulation route. Specifically, on-site circulation was modelled to account for internal Project site travel and the circulation pattern that surrounds the warehouse (for docking and loading/unloading) and the diesel truck parking areas.

EMISSION RATES

Table 3 provides emissions rates by source and emissions factors. For calculations, data outputs, and reference documents please see Appendix 1.

TABLE 3: EMISSION RATES BY SOURCE

Source	Pollutant	Volume/Size	Emission Factor	Emissions Pounds/Year
On-site Diesel Truck (Mobile) Circulation	Diesel Particulate Matter (DPM)	680 truck trips per day traveling 1.61 miles	0.014 g/mile	6.18
Off-site Diesel Truck (Mobile) Circulation	Diesel Particulate Matter (DPM)	680 truck trips per day	0.025 g/mile	8.69
On-site Diesel Truck Idling	Diesel Particulate Matter (DPM)	680 trucks per day idling 5 min	0.25 g/hr -vehicle	0.41

SOURCES: EMFAC 2021; AERMOD; TJKM.

EXPOSURE ASSESSMENT

Exposure assessment involves translating the emission rate (e.g., lbs/hr, g/hr) of individual toxic air contaminants into the concentration (e.g., grams/cubic meter g /sec m² or parts per million) of each toxic air contaminant. The key step in performing an exposure assessment is the application of an air dispersion model. The dispersion model incorporates the local meteorological data (wind speed, wind direction, local temperature, inversions, etc.), stack height, and exhaust flow characteristics, into the dispersion of individual air contaminant. The Lakes Environmental AERMOD Version 11.2.0 dispersion model was employed for this assessment. The AERMOD output file is shown in Appendix 3.

Modeling Receptors: Receptors were placed at locations of nearby sensitive receptors, including residential and workplace locations. Residential receptors were located at each of the nearby residential receptors, as previously described, as follows:

- A cluster of residences is located adjacent to the southwest portion of the Project site, on the opposite side of Dos Reis Road;
- Several residences are located north of and adjacent to Lathrop High School (approximately 940 feet west of the Project site);
- A rural residence is located northwest of the Project site (approximately 820 feet from the Project site);
- A cluster of residences is located north of the northeast portion of the Project site (approximately 320 feet from the Project site), as well as additional residences located along Manthey Road north of the Project site;
- A high concentration of residences is located along the opposite side of Interstate 5, east of the Project site (approximately 400 feet east and northeast of the Project site).

Additionally, workplace receptors were placed at various locations within the Project site. This allows for an analysis of the receptors that have the potential to be most affected by the TACs generated by the proposed project.

Meteorological Data: Five years of meteorological data was used in the exposure assessment. The meteorological (“Met”) data (wind speed, wind direction, temperature, etc.) were recorded at the Stockton Airport location for the years 2013 through 2017. This location was the closest location MET data was available.

RISK ASSESSMENT

Once the emissions rates of individual air contaminants have been calculated, and an air dispersion model has been run through AERMOD, the next step in determining health risks is to determine the cancer risk, and acute and chronic incident rates. Period and 1-hour dispersion files we used in combination with HARP-2 risk modelling software to calculate risk scenarios for residential, and workplace cancer rates, as well as acute and chronic incidences. The Hotspots Analysis and Reporting Program (HARP) is a software suite used to assist with the programmatic requirements of the Air Toxics “Hot Spots” Program [Assembly Bill (AB) 2588]. HARP combines the tools needed to implement the requirements of AB 2588, such as reporting a facilities

emissions inventory, determining a facilities prioritization score, conducting air dispersion modeling, and performing a facility health risk assessment. This study utilized the HARP2 Air Dispersion and Risk Tool with dispersion plot files created in AERMOD. After the risk assessment was complete, HARP-2 plot files were then imported back into AERMOD for spatial and visual representation, and analysis of impact areas.

The Intake Rate Percentile sets the intake rate at which a person is exposed to the air pollutant. This study utilized the high-end intake rate to assess risk at the 95th percentile exposure rate for risk scenarios (see Appendix 4 HARP-2 project summary report). Additionally, residential cancer risk is assessed using a 70-year exposure duration starting at the third trimester; workplace cancer risks are assessed at a 40-year exposure duration with age 16 being the first potential exposure year.

RISK ASSESSMENT RESULTS

The results of the risk analysis indicate that cancer risks vary depending on the exposure scenario (residential or worker) and on location. As would be expected, locations nearest the Project site have the greatest exposure and the associated risks are considerably lower as distance from the project site increases. Table 4 displays the residential and workplace cancer risk, and acute and chronic incidence rate results at nearest receptors. Figure 3 provides wind patterns at the Stockton Airport location where meteorological data was used for the modeling.

TABLE 4: SUMMARY OF MAXIMUM HEALTH RISKS

<i>RISK METRIC</i>	<i>MAXIMUM RISK</i>	<i>SIGNIFICANCE THRESHOLD</i>	<i>IS THRESHOLD EXCEEDED?</i>
Residential Cancer Risk (70-year exposure)	7.0	20 per million	No
Workplace Cancer Risk (40-year exposure)	1.3	20 per million	No
Chronic (non-cancer)	<0.01	Hazard Index ≥ 1	No
Acute (non-cancer) ¹	0	Hazard Index ≥ 1	No

SOURCES: AERMOD 11.2.0 (LAKES ENVIRONMENTAL SOFTWARE, 2023); AND HARP-2 AIR DISPERSION AND RISK TOOL.

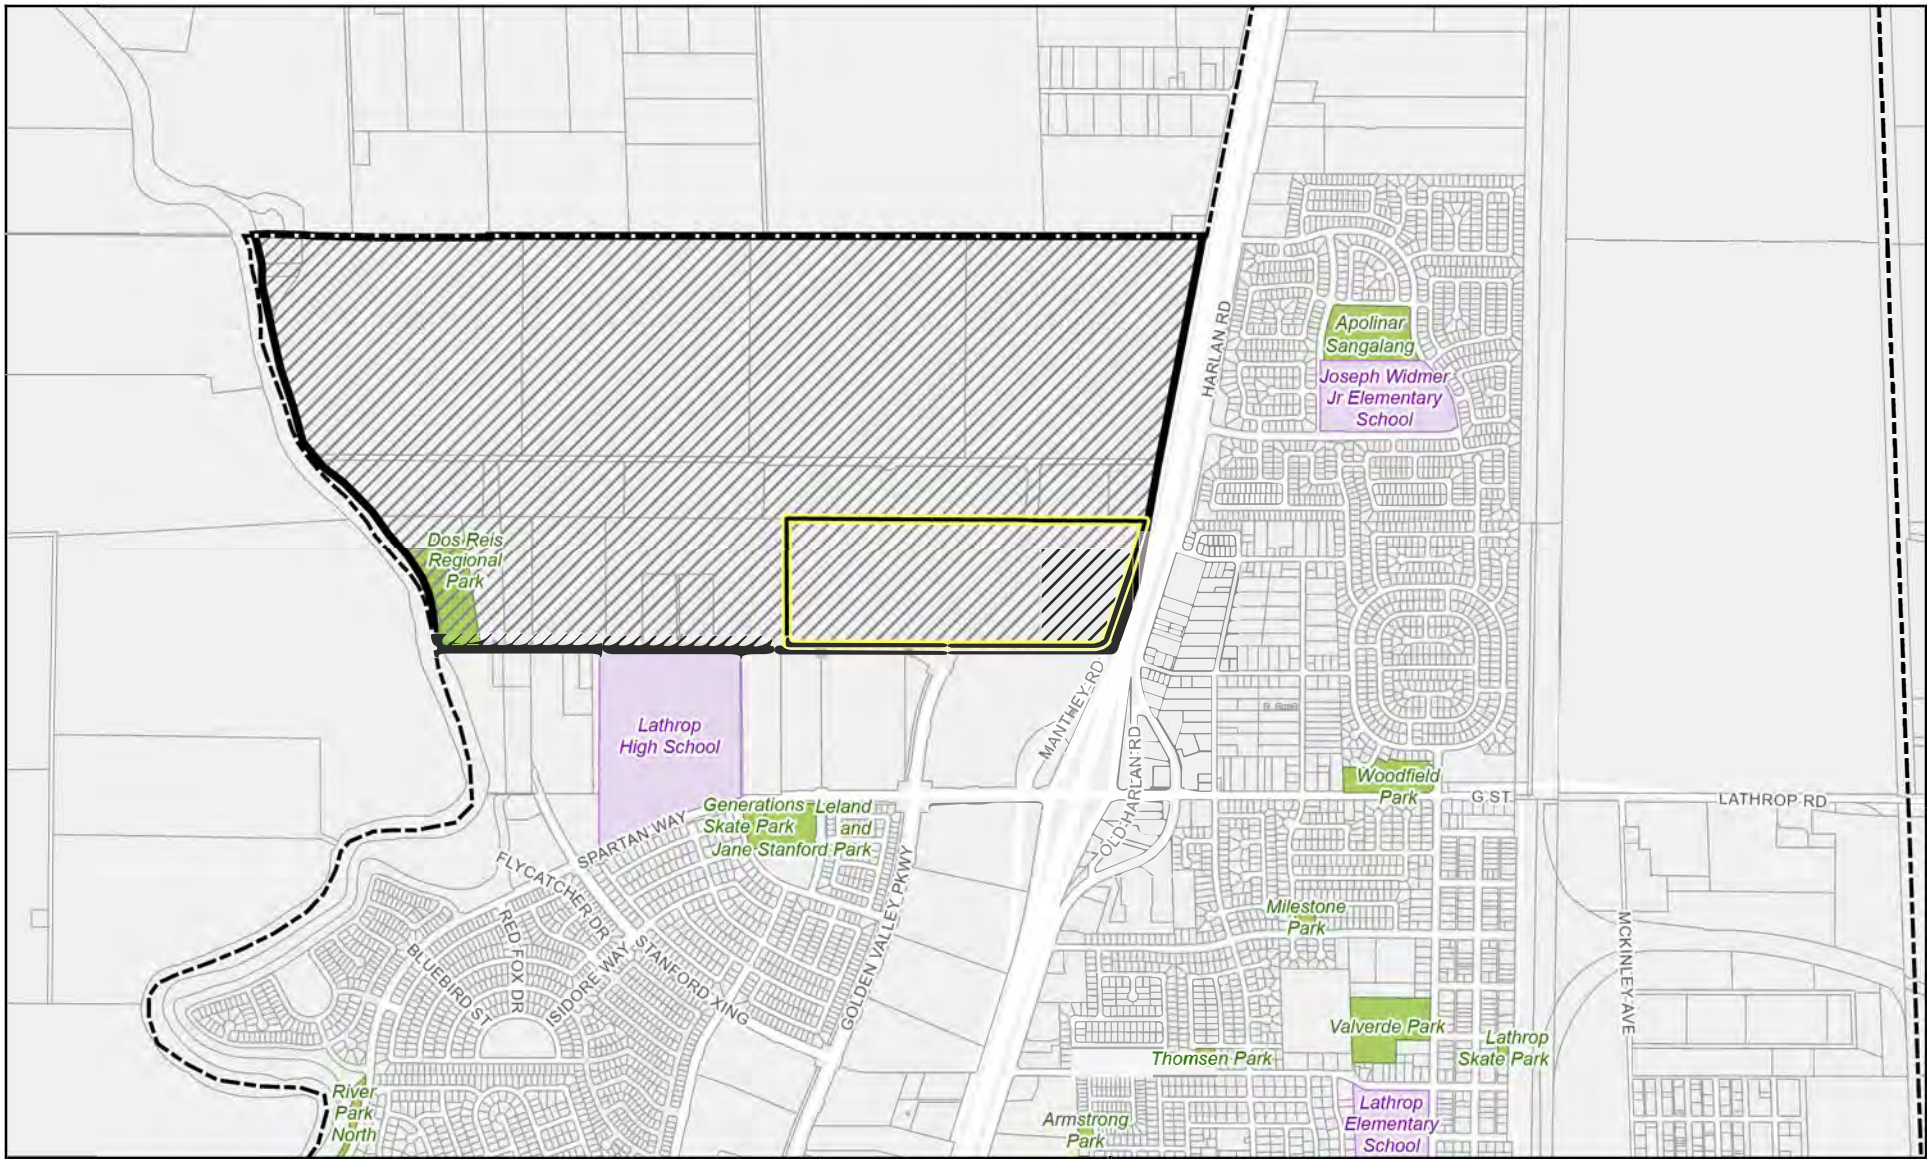

The TAC emissions from the project result from the on-site and off-site truck travel, and on-site idling of diesel-fueled vehicles. The nearest sensitive receptors are those that surround the Project site, to the southwest, west, east, and northeast.

Overall, the results show that residential 70-year cancer risk would remain below the threshold of 20 in a million at areas near the project site that contain residential receptors. As shown in Figure 3, the wind patterns in the area generally blow from the northwest to the southeast. The modeling results show that the residence with the highest risk is the residence located north of the Project site along Manthey Road, at 12965 Manthey Road. However, it is very unlikely any individual would remain at the same location for 70 years; therefore, this result represents a

conservative estimate. Figure 4 provides a visualization of the residential cancer risk isopleths surrounding the Project site.

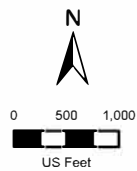

The results also show that 40-year workplace cancer risk would remain below the threshold of 20 in a million (the SJVPACD threshold) at the project site, with a maximum value measured at approximately 1.3 per million (at the location of maximum cancer risk), in the northeastern portion of the Project site. Figure 4 provides the a visualization of the workplace cancer risk isopleths surrounding the Project site.

Chronic or long-term exposures and Acute exposure to DPM can result is non-cancer health effects. Chronic and Acute Non-Cancer Hazards results show that the acute and chronic risk on and near the project site would remain below the hazard index of ≥ 1 .

Mobile Truck Emissions - On-site Mobile

meters per mile: 1609.34 pounds per gram: 0.002205

Assumptions:

1. Distance travelled on-site per truck (line segment): 1.61183687 miles
2. # of trucks trips per day (total): 680 trucks
3. Proportion of project site traveled per truck per day: 0.5
3. PM10 Mobile Em. Factor (San Joaquin County, Year 2022, 10 MPH, T7 Tractor Class 8):

Source:

AERMOD
TJKM
Based on site plan and layout.
0.014004 g/mile

Therefore:

Total daily PM10 On-site Mobile Emissions Generated by the project:

7.67426518 g/day-all trucks

0.01691884 lbs/day-all trucks

6.17537606 lbs/year-all trucks

Max Hr Emissions

Two times the average trip generation over the course of 1 hour, based on the given 24-hour daily totals (conservative estimate)

0.001410 lbs/hour-all trucks

Mobile Truck Emissions - Off-site - Manthey Road - North

meters per mile: 1609.34 pounds per gram: 0.002205

Assumptions:

1. Distance travelled on-site per truck (line segment): 0.6451697 miles
2. # of trucks trips per day (prorated - 2 routes): 340 truck trips
3. PM10 Mobile Em. Factor (San Joaquin County, Year 2022 Aggregate MPH, T7 Tractor Class 8):

Source:

AERMOD
TJKM, 2023
0.024608 g/mile

Therefore:

Total daily PM10 On-site Mobile Emissions Generated:

5.39794296 g/day-all trucks
0.01190041 lbs/day-all trucks
4.34365075 lbs/year-all trucks

Max Hr Emissions

Two times the average trip generation over the course of 1 hour, based on the given 24-hour daily totals (conservative estimate)

0.000992 lbs/hour-all trucks

Mobile Truck Emissions - Off-site - Manthey Road - South

meters per mile: 1609.34 pounds per gram: 0.002205

Assumptions:

1. Distance travelled on-site per truck (line segment): 0.6451697 miles
2. # of trucks trips per day (prorated - 2 routes): 340 truck trips
3. PM10 Mobile Em. Factor (San Joaquin County, Year 2022 Aggregate MPH, T7 Tractor Class 8):

Source:

AERMOD
TJKM, 2023
0.024608 g/mile

Therefore:

Total daily PM10 On-site Mobile Emissions Generated:

5.39794296 g/day-all trucks
0.01190041 lbs/day-all trucks
4.34365075 lbs/year-all trucks

Max Hr Emissions

Two times the average trip generation over the course of 1 hour, based on the given 24-hour daily totals (conservative estimate)

0.000992 lbs/hour-all trucks

Truck Idling

CARB EMFAC2021 idling emission factors for 2022 HHDT diesel trucks:

PM10	0.25 g/hr-truck	pounds per gram:	0.002205
	0.01041667 g/5 minutes-truck		
	0.01041667 g/day-truck		
	680 Total # of trucks per day		
	7.08333333 g/day-all trucks		
	2585.41667 g/year-all trucks		
	5.69986129 lbs/year-all trucks

EXECUTIVE SUMMARY

This report summarizes the results of the Traffic Impact Analysis (TIA) conducted for the proposed Ashley Furniture distribution center in the City of Lathrop, California. The study area is near the Roth Road and Lathrop Road interchanges on I-5, specifically located northwest of the I-5/Lathrop Road interchange.

The project proposes to develop an approximately 1.5+ million square feet building to serve as a distribution center and retail facility. The development is strategically located near the I-5/Lathrop Road interchange. The project will also construct various driveways to serve as entry points for passenger vehicles and heavy trucks. The project also proposes to construct a roundabout at the intersection of Golden Valley Parkway/Dos Reis Road.

The purpose of the Traffic Impact Analysis is to evaluate the impacts on the transportation infrastructure due to the addition of the traffic from the proposed project. The report also includes evaluations and recommendations concerning project site access and on-site circulation for vehicles, bicycles, and pedestrians, and a vehicle miles travelled analysis.

To evaluate the impacts on the transportation infrastructure due to the addition of traffic from the proposed project, 14 study intersection were evaluated during the weekday morning (a.m.) peak hour and evening (p.m.) peak hour under five study scenarios. The study intersections were evaluated under *No Project* and *Plus Project* scenarios for Baseline Conditions and Cumulative Conditions. The study intersections were also evaluated for Existing Conditions. For the purpose of this analysis, potential traffic operational effects from the proposed project are identified based on established operational thresholds for the City of Lathrop and guidance published by the California Office of Planning and Research (OPR).

Of note, this TIA constitutes a second iteration of the report based on feedback received from the City. This iteration includes the addition of the Cumulative and Cumulative plus Project conditions and changes to the site layout. The latter change accounted for the removal of two previous site entrances (Study Intersections #13 and #16); in order to avoid confusion and to keep consistent with the previous TIA, the intersection numbering herein has not be revised.

Project Trip Generation

Using site specific data, the proposed Ashley Furniture is expected to generate 2,798 daily trips, including 203 a.m. peak hour trips (124 inbound, 79 outbound) and 255 p.m. peak hour trips (110 inbound, 145 outbound) for passenger vehicles.

In addition, the project is expected to generate 680 daily heavy truck trips, including 95 a.m. peak hour trips (14 inbound, 81 outbound) and 45 p.m. peak hour trips (31 inbound, 14 outbound).

Existing Conditions – Intersection Level of Service

Under this scenario, all of the study intersections operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour.

Existing Conditions – Freeway Mainline Level of Service

Under this scenario, all of the study freeway segments operate at acceptable levels of service (LOS D or better) during the a.m. and p.m. peak hour.

Baseline Conditions – Intersection Level of Service

Baseline conditions include all approved growth expected to be constructed between the year 2020 and the year 2022. Under this scenario, all of the study intersections operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour, except for Lathrop Rd/I-5 NB Ramps (Intersection #2) during the p.m. peak hour, which is projected to operate at LOS E (average delay of 70.4 seconds).

Baseline Conditions – Freeway Mainline Level of Service

Under this scenario, all of the study freeway segments are projected to operate at acceptable levels of service (LOS D or better) during the a.m. and p.m. peak hour.

Baseline plus Project Conditions – Intersection Level of Service

Under this scenario, all but three of the study intersections would continue to operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour. The following intersection already operates at unacceptable level of service without the addition of project traffic.

- Lathrop Rd/I-5 NB Ramps (Intersection #2) degrades to LOS F in the p.m. peak hour, with an increase in average delay of 19.1 seconds.
 - With the recommended improvements described in Section 5.3.1, the intersection is projected to improve to LOS C in the a.m. and p.m. peak hours, with a delay of 20.2 seconds and 34.8 seconds, respectively.

The following two intersections would degrade from acceptable to unacceptable level of service with the addition of project traffic:

- Lathrop Rd-Spartan Way/I-5 SB Ramps (Intersection #3) would degrade from LOS D to LOS E in the a.m. and p.m. peak hour, a *substantial degradation*.
 - With the recommended improvements described in Section 5.3.1, the intersection is projected to improve to LOS D in the a.m. and p.m. peak hours, with a delay of 54.5 seconds and 54.9 seconds, respectively.
- Spartan Way/Golden Valley Pkwy (Intersection #4) would degrade from LOS C to LOS E in the a.m. peak hour and LOS D to LOS F in the p.m. peak hour, a *substantial degradation*.
 - With the recommended improvements described in Section 5.3.1, the intersection is projected to improve to LOS D in the a.m. and p.m. peak hours, with a delay of 48.5 seconds and 52.9 seconds, respectively.

Baseline plus Project Conditions – Freeway Mainline Level of Service

Under this scenario, all of the study freeway segments are projected to operate at acceptable levels of service (LOS D or better) during the a.m. and p.m. peak hour.

Cumulative Conditions – Intersection Level of Service

Under this scenario, seven of the study intersections are projected to operate below applicable jurisdictional standards during one or both peak hours. Three intersections at or near the Lathrop Road/I-5 interchange and four intersections at or near the Roth Road/I-5 interchange would operate at LOS F during one or both peak hours. The remaining intersections would operate within applicable standards during the a.m. and p.m. peak hours.

Cumulative plus Project Conditions – Intersection Level of Service

Under this scenario, seven of the study intersections are projected to continue to operate below applicable jurisdictional standards during one or both peak hours. Three intersections at or near the Lathrop Road/I-5 interchange and four intersections at or near the Roth Road/I-5 interchange would operate at LOS F during one or both peak hours. The remaining intersections would operate within applicable standards during the a.m. and p.m. peak hours. At the seven intersections operating below jurisdictional standards, added project traffic would either degrade the level of service from acceptable to unacceptable, or increase average delay by more than 5.0 seconds, constituting *substantial inconsistencies* with the City of Lathrop standards.

A fair share analysis was conducted at the Lathrop Road/I-5 interchange and the Roth Road/I-5 interchange. At the Lathrop Road/I-5 interchange, individual intersection fair share percentages range from approximately one percent to six percent (or 5.1 percent overall). At the Roth Road/I-5 interchange, individual intersection fair share percentages range from approximately one percent to nine percent (or 4.5 percent overall).

VMT Impacts

The proposed project was evaluated based on guidance from the Governor’s Office of Planning and Research (OPR) and San Joaquin County Transportation Analysis Guidelines. Since the project is not screened out from the maps in the County Guidelines, TJKM inserted the proposed project into the San Joaquin COG 2018 RTP model and performed a base year plus project model run.

The project’s 15.43 daily VMT per employee is lower than the San Joaquin County VMT threshold of 16.2. VMT impacts for the Ashley Furniture Homestore project are found to be **less-than-significant** for the base year, and thus no mitigation is required for VMT impacts attributable to this project.

Site Access & On-Site Circulation

The project would be accessed by a total of four driveways. All driveways are full access driveways. Heavy trucks (larger than SU-30) will generally be restricted to only using the northern driveway on Manthey Road and the I-5/Roth Road interchange. Drive aisles for passenger vehicles vary between 26-36 feet wide, while drive aisles for heavy trucks are 60-72 feet wide. Any proposed landscaping should be maintained to provide adequate sight distance. The proposed driveway locations, design, and sight distance are all **adequate**.

The site plan shows all proposed pedestrian facilities on the project frontage and connectivity from Manthey Road to the retail showroom entrance. The project site plan does show four crosswalks connecting the passenger vehicle parking lot to the retail showroom. The site plan shows two bike rack locations, one on the south side of the building and one on the east side. Sidewalks are planned to be provided within the passenger vehicle parking lot and along the eastern frontage of the building. Additionally, it appears that

one sidewalk will front the Intersection #15 entrance (on the north side) that will connect the showroom to Manthey Road. The internal circulation on the project site is considered **adequate**.

Truck Operations

The proposed Ashley furniture is proposing to restrict heavy trucks (larger than SU-30) from using the Lathrop Road/I-5 interchange at all times to alleviate potential congestion on those intersections. Instead, trucks will be using the Roth Road/I-5 interchange via Manthey Road to access the Ashley Furniture site via the northernmost driveway only. Only local delivery trucks would be permitted on Dos Reis Boulevard and Golden Valley Parkway. Based on the level of service analysis, additional truck traffic on the Roth Road intersections is not expected to degrade the LOS to unacceptable operations.

Parking

Based on City of Lathrop parking requirements, the project is required to provide 893 stalls. Based on the site plan, the project is proposing to provide 942 stalls, satisfying City requirements. The project will provide 1,104 trailer stalls for company operations.

Pedestrian Impacts

Pedestrian access to the project site is facilitated by new sidewalks along Dos Reis Road and Manthey Road, and paved walkways within the parking lot and crosswalks. The proposed development project does not conflict with existing and planned pedestrian facilities; therefore, the impact to pedestrian facilities is **less than significant**.

Bicycle Impacts

As shown in **Figure 3**, there are no existing bicycle facilities on De Lima Road, Manthey Road and Dos Reis Road. If the project proposes bicycle facilities, it should show them on future site plans. The project does not conflict with existing and planned bicycle facilities; therefore, the impact to bicycle facilities is **less than significant**.

Transit Impacts

The project site is within a 3/4 mile of two San Joaquin RTD bus stops, located on the northwest corner of Lathrop Road/Harlan Road and in front of the Save Mart. Due to the lack of development north of Spartan Way, there are sidewalk gaps from the proposed project site to the bus stops. As development in the area increases, sidewalks should be installed to close the gap in pedestrian facilities. Impacts to transit service are expected to be **less than significant**.

1.0 INTRODUCTION

This report summarizes the results of the Traffic Impact Analysis (TIA) for the proposed Ashley Furniture distribution center located north of the Spartan Way and Golden Valley Parkway intersection in the City of Lathrop, California. The location is northwest of the I-5/Lathrop Road interchange.

1.1 PROJECT DESCRIPTION

The project proposes to develop a 1.5+ million square foot building to serve as a distribution center and retail facility. The development is strategically located near the I-5/Lathrop Road interchange, although heavy trucks will be restricted to only using the I-5/Roth Road interchange to the north. The project will include various driveways to serve as entry points for passenger vehicles and heavy trucks. The project also proposes to construct a roundabout at the intersection of Golden Valley Parkway/Dos Reis Road.

The following section discusses the TIA's purpose, study intersections, and analysis scenarios.

1.2 PROJECT PURPOSE

The purpose of the Traffic Impact Analysis is to evaluate the impacts on the transportation infrastructure due to the addition of the traffic from the proposed project. The report also includes evaluations and recommendations concerning project site access and on-site circulation for vehicles, bicycles, and pedestrians, queuing analysis at the study intersections, and parking supply.

1.3 OTHER ANALYSES

The City of Lathrop has recently updated its General Plan. The Lathrop City Council voted to adopt the General Plan Update and certify the Final Environmental Impact Report (FEIR) on September 19, 2022.

1.4 STUDY AREA

The study area is located within the city limits of Lathrop, within the Central Lathrop Specific Plan Phase 2 area. The impacts of the proposed project were evaluated for the intersections discussed below.

1.4.1 Study Intersections

TJKM evaluated traffic conditions at 14 study intersections during the a.m. and p.m. peak hours for a typical weekday. The study intersections were selected in consultation with the City of Lathrop staff. The peak periods in the City of Lathrop are between 6-9 a.m. and 3-6 p.m. The study intersections and associated traffic controls are as follows:

1. Lathrop Rd/Harlan Rd (Signal)
2. Lathrop Rd/I-5 NB Ramps* (Signal)
3. Lathrop Rd-Spartan Way/I-5 SB Ramps* (Signal)
4. Spartan Way/Golden Valley Pkwy (Signal)
5. Manthey Rd/De Lima Rd (One-Way Stop)
6. Manthey Rd/Dos Reis Rd (One-Way Stop)
7. Golden Valley Rd/Dos Reis Rd (Intersection does not currently exist)
8. Manthey Rd/Roth Rd (One-Way Stop)
9. Roth Rd/I-5 SB Ramps* (One-Way Stop)

10. Roth Rd/I-5 NB Ramps* (One-Way Stop)
11. Roth Rd/Harlan Rd (All-Way Stop)
12. Dos Reis Rd/Ashley Driveway #1 (One-Way Stop)
14. Manthey Rd/Ashley Driveway #3 (One-Way Stop)
15. Manthey Rd/Ashley Driveway #4 (One-Way Stop)

Notes:

() indicates that a intersection is owned and operated by Caltrans*

In a previous version of this TIA, there were 16 study intersections. Intersections #13 (Manthey Rd/Ashley Driveway #2) and #16 (De Lima Rd/Ashley Truck Driveway) have been removed as per the latest plan update.

Figure 1 illustrates the study intersections and the vicinity map of the proposed project. **Figure 2** shows the proposed project site plan, dated March 29, 2023.

1.4.2 Study Freeway Segments

TJKM also evaluated freeway mainline operations for the a.m. and p.m. peak hours for a typical weekday. The following freeway segments were selected in consultation with the City of Lathrop staff:

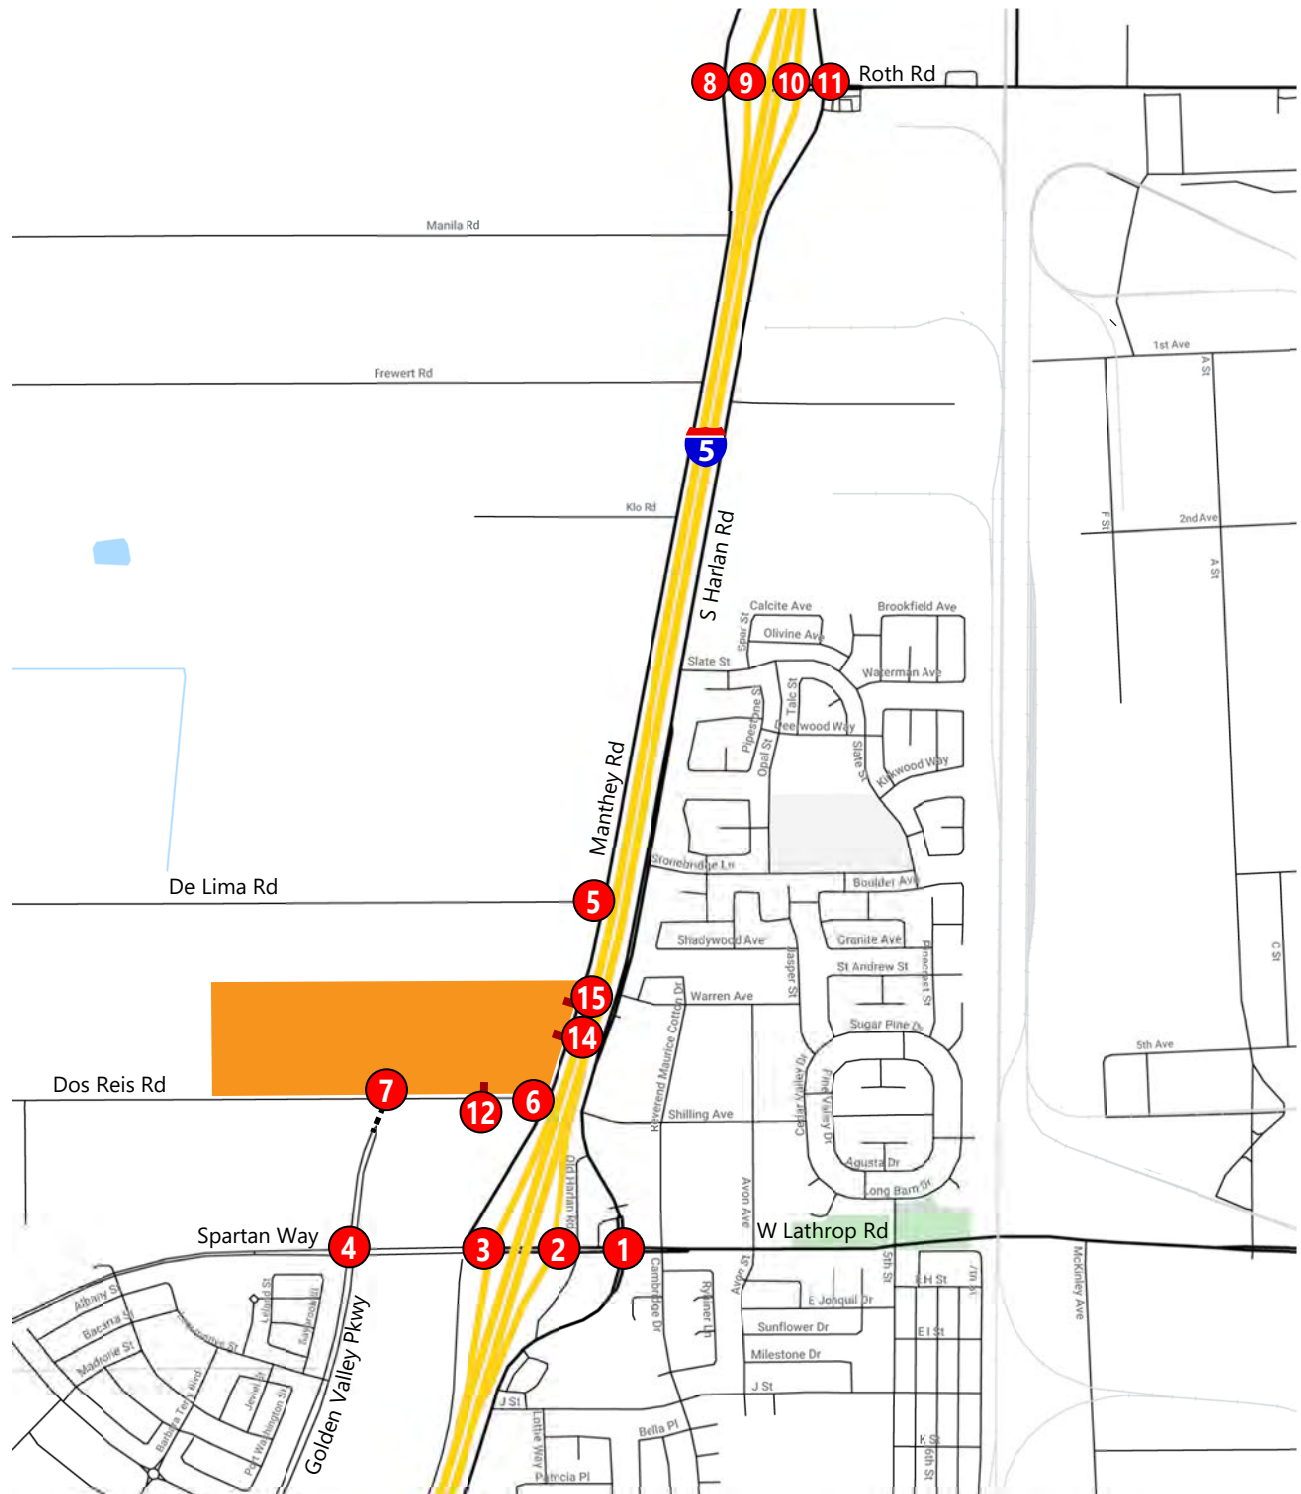

1. Interstate 5, north of Roth Road (northbound and southbound directions)
2. Interstate 5, between Roth Road and Lathrop Road (northbound and southbound directions)
3. Interstate 5, south of Lathrop Road (northbound and southbound directions)

1.5 ANALYSIS SCENARIOS

This study addresses the following five traffic scenarios:

- Existing Conditions;
- Existing plus Approved Projects (Baseline);
- Baseline plus Ashley Furniture Project;
- Cumulative Conditions; and
- Cumulative plus Ashley Furniture Project.

Figure 1: Vicinity Map

2.0 STUDY METHODOLOGY

Traffic impacts related to the proposed project were evaluated for both compliance with applicable regulatory documents and environmental significance as defined in the California Environmental Quality Act (CEQA). In accordance with the *Technical Advisory* published by the Governor's Office of Planning and Research (OPR), a qualitative VMT analysis forms the basis of the CEQA analysis for the proposed project. As of July 1, 2020, intersection level of service (LOS) can no longer be used to determine significant impacts for CEQA purposes. The City of Lathrop adopted VMT thresholds and screening criteria on September 14, 2020.

2.1 VEHICLE MILES TRAVELED

This study includes a quantitative analysis of VMT generated by the proposed project. SB 743 is intended to reduce greenhouse gas emissions and particulates, encourage infill development and a diversity of uses instead of sprawl; and promote multi-modal transportation networks.

The San Joaquin COG 2018 RTP Model was used to evaluate changes in VMT due to land use developments. For the purposes of this study, the screening guidelines and significance thresholds that are contained in the City's VMT guidelines are utilized. If a project does not meet any screening criteria, the draft guidelines specify use of the San Joaquin COG RTP Travel Demand Model to identify the appropriate project VMT.

City of Lathrop Screening Criteria

The adopted guidelines include the following screening criteria for identifying projects that can be presumed to have a less-than-significant impact:

- Small projects;
- Projects located in low VMT areas;
- Projects in proximity to a major transit stop;
- Affordable housing
- Local serving retail; and
- Transportation projects

Significance Standards

The state of California provides lead agencies latitude in adopting standards of significance for evaluating VMT impacts associated with land use projects. For this project, the San Joaquin County Transportation Analysis Guidelines were used to analyze the proposed project since the City of Lathrop VMT guidelines do not specify VMT thresholds.

2.2 LEVEL OF SERVICE ANALYSIS METHODOLOGY

Level of Service (LOS) is a qualitative measure that describes operational conditions as they relate to the traffic stream and perceptions by motorists and passengers. The LOS generally describes these conditions in terms of such factors as speed and travel time, delays, freedom to maneuver, traffic interruptions, comfort, convenience and safety. The operational LOS are given letter designations from A to F, with A representing the free-flow operating conditions and F representing the severely congested flow with high delays.

Typically, LOS C is considered as an ideal condition as it represents stable flow and efficient use of the transportation facility. Intersections generally are the capacity-controlling locations with respect to traffic operations on arterial and collector streets. The following sections provide detailed study methodology based on the type of intersections.

Signalized Intersections

The study intersections under traffic signal control were analyzed using the Highway Capacity Manual (HCM 6th Edition) methodology for signalized intersections described in Chapter 19. This methodology determines LOS based on average control delay per vehicle for the overall intersection during peak hour intersection operating conditions. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. **Table 1** summarizes the relationship between the control delay and LOS for signalized intersections. The LOS assessment under all scenarios is based on current traffic controls and optimized signal timing unless otherwise noted. The LOS methodology for Signalized intersections is described in detail in **Appendix A**.

Table 1: Level of Service Definitions for Signalized Intersections

<i>Level of Service</i>	<i>Description</i>
A	Very low control delay, up to 10 seconds per vehicle. Progression is extremely favorable, and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	Control delay greater than 10 and up to 20 seconds per vehicle. There is good progression or short cycle lengths or both. More vehicles stop causing higher levels of delay.
C	Control delay greater than 20 and up to 35 seconds per vehicle. Higher delays are caused by fair progression or longer cycle lengths or both. Individual cycle failures may begin to appear. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflow occurs. The number of vehicles stopping is significant, though many still pass through the intersection without stopping.
D	Control delay greater than 35 and up to 55 seconds per vehicle. The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volumes. Many vehicles stop, the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	Control delay greater than 55 and up to 80 seconds per vehicle. The limit of acceptable delay. High delays usually indicate poor progression, long cycle lengths, and high volumes. Individual cycle failures are frequent.
F	Control delay in excess of 80 seconds per vehicle. Unacceptable to most drivers. Oversaturation, arrival flow rates exceed the capacity of the intersection. Many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to higher delay.

Source: Highway Capacity Manual 6th Edition

Stop-Controlled Intersections

The study intersections under one/two-way stop control and all-way stop control were analyzed using the HCM 6th Edition Operations Methodology described in Chapter 20 and 21, respectively. LOS ratings for stop-sign controlled intersections are based on the average control delay expressed in seconds per vehicle. At one- or two-way stop controlled intersections, the control delay is calculated for each movement, not for the intersection as a whole. For approaches composed of a single lane, the control delay is computed as the average of all movements in that lane. The weighted average delay for the entire intersections is presented for all-way stop controlled intersections. **Table 2** summarizes the relationship between delay and LOS for stop-controlled intersections. The delay ranges for unsignalized intersections are lower than for signalized intersections, as drivers expect less delay at stop-controlled intersections.

Each of the study intersections was analyzed using *Synchro* software and HCM 6th Edition. The LOS assessment under all scenarios is based on current traffic controls unless otherwise noted. The LOS methodology for stop-controlled intersections is described in detail in **Appendix A**.

Table 2: Level of Service Definitions for Stop Controlled Intersections

Level of Service	Description
A	Very low control delay less than 10 seconds per vehicle for each movement subject to delay.
B	Low control delay greater than 10 and up to 15 seconds per vehicle for each movement subject to delay.
C	Acceptable control delay greater than 15 and up to 25 seconds per vehicle for each movement subject to delay.
D	Tolerable control delay greater than 25 and up to 35 seconds per vehicle for each movement subject to delay.
E	Limit of tolerable control delay greater than 35 and up to 50 seconds per vehicle for each movement subject to delay.
F	Unacceptable control delay in excess of 50 seconds per vehicle for each movement subject to delay.

Source: Highway Capacity Manual 6th Edition

2.3 LEVEL OF SERVICE STANDARDS

Although level of service is no longer used for identifying impacts under CEQA, level of service analysis is still used for determining consistency with adopted agency plans and standards. Where standards refer to significant environmental impacts, this analysis instead identifies these as significant inconsistencies with adopted plans.

Signalized and Stop Controlled Intersections

The City of Lathrop LOS standard is LOS D. Intersections that are expected to operate below LOS D are considered as impacted and should be considered for improvement.

While the City of Lathrop does not have specific impact criteria for intersections, a project impact would be considered substantial if:

- The project traffic added to existing conditions would result in the level of service deteriorating below the City standard. The City’s current level of service standard is LOS D.
- For intersections that already operate at unacceptable levels of service (E or F), project impacts can be considered substantial if the project trips result in an increase in delay by 5.0 seconds or more.

Caltrans Facilities

Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on all State highway facilities. Based on standard industry practice, the project is considered to trigger a substantial impact to Caltrans Facilities if the project would:

- Result in a facility that will operate at an acceptable LOS in the base (pre-project or no project) condition to deteriorate to unacceptable LOS in the “Plus Project” condition; or
- Project traffic increases the density by five percent or more at a facility that will operate at an unacceptable LOS in the base (pre-project or no project) condition.

Table 3 summarizes the HCM 6th Edition LOS criteria for basic freeway segments. *Highway Capacity Software* (HCS7) was used to calculate the level of service along freeway segments for all scenarios. For this analysis, LOS D is the acceptable threshold.

Table 3: LOS Criteria for Basic Freeway Segments

<i>Freeway Facility LOS</i>	<i>Freeway Facility Density (pc/mi/ln)</i>
A	≤11
B	>11-18
C	>18-26
D	>26-35
E	>35-45
F	>45 or v/c > 1.0

Source: HCM 6th Edition

3.0 EXISTING CONDITIONS

This section describes existing conditions in the immediate project site vicinity, including roadway facilities, bicycle and pedestrian facilities, and available transit service. In addition, existing traffic volumes and operations are presented for the study intersections, including the results of LOS calculations.

3.1 EXISTING SETTING AND ROADWAY SYSTEM

Access to the proposed project is provided via Lathrop Road/Spartan Way, Manthey Road, Golden Valley Parkway, Dos Reis Road and De Lima Road.

Lathrop Road/Spartan Way is primarily a four to six lane divided arterial from its western terminus at Barbara Terry Boulevard and its eastern terminus at Austin Road in Manteca. In the project vicinity, the majority of land uses will be primarily single family homes and educational facilities. The posted speed limit on Lathrop Road/Spartan Way is 35 miles per hour (mph).

Manthey Road is primarily a two lane undivided, rural road from Lathrop Road/Spartan Way to Carolyn Weston Boulevard in south Stockton. In the immediate project vicinity, the majority of land uses are open space/agricultural with a few single family home along the roadway. The posted speed limit ranges from 40-45 mph.

Golden Valley Parkway is primarily a six lane divided arterial from Spartan Way to its southern terminus at Brookhurst Boulevard. Golden Valley Parkway will primarily serve as the primary north-south arterial for residents in Central Lathrop. While much of the land surrounding Golden Valley Parkway is undeveloped, Golden Valley Parkway provides access to single family homes and Lathrop Marketplace. In the project vicinity, the posted speed limit is 45 mph.

Dos Reis Road is a two lane rural road from Manthey Road to its western terminus at the San Joaquin River. Dos Reis Road will provide access driveways to the proposed project. Most of the land uses are open space/agriculture. However, there is access to the athletic facilities of Lathrop High School. The speed limit on Dos Reis Road is 35 mph.

De Lima Road is a two lane rural road from Manthey Road to its western terminus at the San Joaquin River. De Lima Road will also provide access driveways to the proposed project. The land uses surrounded De Lima Road are mostly open space and agricultural. The speed limit along De Lima Road is 35 mph.

3.2 EXISTING PEDESTRIAN FACILITIES

Walkability is defined as the ability to travel easily and safely between various origins and destinations without having to rely on automobiles or other motorized travel. The ideal “walkable” community includes wide sidewalks, a mix of land uses such as residential, employment, and shopping opportunities, a limited number of conflict points with vehicle traffic, easy access to transit facilities and services and a network of pedestrian facilities.

Pedestrian facilities are comprised of crosswalks, sidewalks, pedestrian signals, and off-street paths, which provide safe and convenient routes for pedestrians to access the destinations such as institutions, businesses, public transportation, and recreation facilities.

Near the proposed project site, the approximate width of the sidewalk is eight feet. This sidewalk width applies to segments of Spartan Way. There are currently no sidewalks along Golden Valley Parkway (north of Spartan Way), Dos Reis Road, Manthey Road, and De Lima Road. The project proposes to develop sidewalks along Dos Reis Road and the west side of Manthey Road.

The signalized intersections provide marked crosswalks and pedestrian push buttons and signal heads.

The existing pedestrian facilities in the study area are shown in **Figure 3**.

3.3 EXISTING BICYCLE FACILITIES

The 1995 City of Lathrop Bicycle Transportation Plan outlines policies and objectives to improve the current active bicycle facilities. The various bicycle facilities are described below. Existing bicycle facilities are illustrated in **Figure 3**.

- **Class I Bikeways (Bike Paths or Shared-Use Path):** Class I Bikeways provides a completely separated right of way for bicycles and pedestrians with minimal crossflow by motorized vehicles. Bike paths provide a recreational opportunity or can serve as commute routes. In the project area, there are no Class I facilities.
- **Class II Bike Lanes:** Class II bike lanes are striped bike lanes immediately adjacent to a traffic lane. Bike lanes provide a separate pavement area from vehicular traffic and improve conditions for bicycles on roadways. In the project vicinity, Class II Bike Lanes are provided on Lathrop Road and Harlan Road.
- **Class III Bike Routes:** Class III Bike Routes provide shared use of the roadway, designated by signs or permanent markings and shared with other vehicular traffic. There are no Class III Bike Routes in the project vicinity.
- **Class IV Separated Bikeways or Cycle Tracks:** Cycle tracks are separated bikeways for the exclusive use of bicycles. Cycle tracks are usually located along the roadway, but require separation from the vehicular travel lane in the form of grade separation, planters, flexible posts, or on-street parking. There are no Class IV bikeways in the project vicinity.

3.4 EXISTING TRANSIT FACILITIES

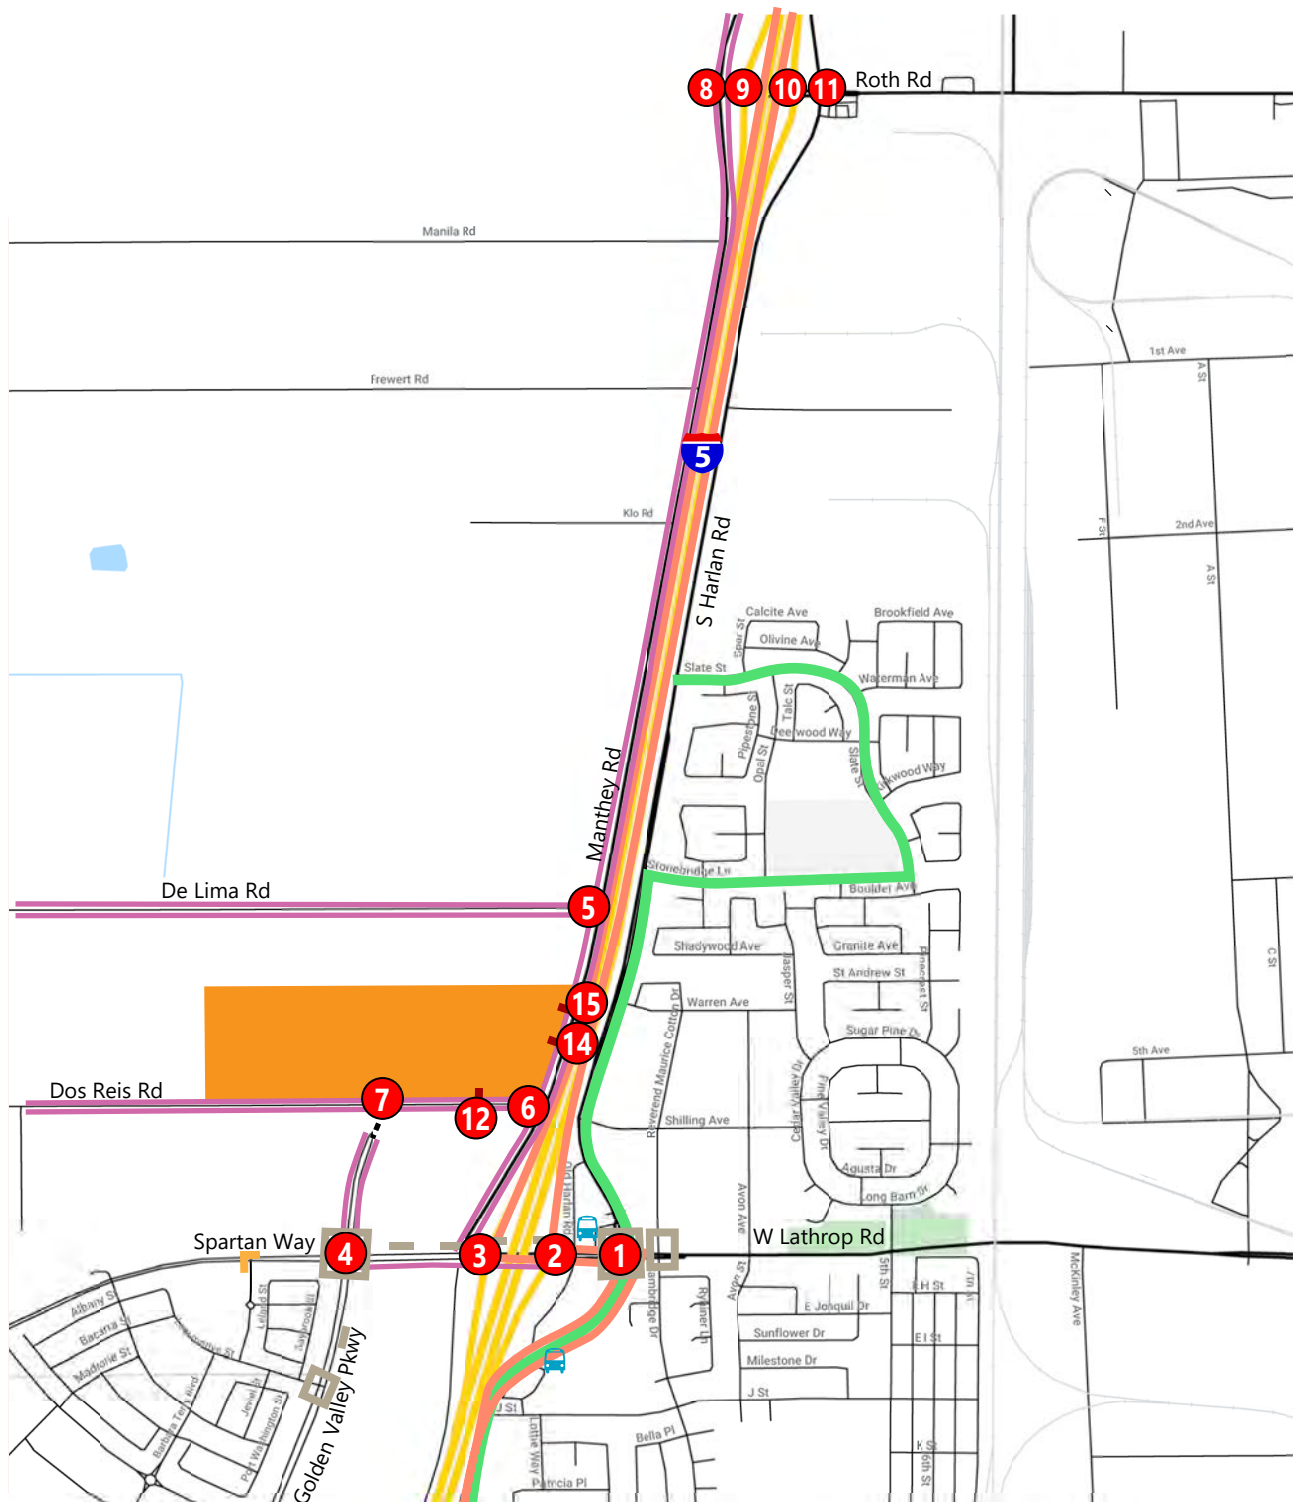

San Joaquin Regional Transit District (RTD) provides transit service throughout the San Joaquin County. **Table 4** summarizes the existing San Joaquin RTD Transit service and **Figure 3** illustrates the existing transit facilities in the study area.

Table 4: Existing San Joaquin RTD Transit Service

3.5 EXISTING PEAK HOUR TRAFFIC VOLUMES AND LANE CONFIGURATIONS

The existing operations of the study intersections were evaluated for the highest one-hour volumes during weekday morning and evening peak periods. Due to COVID-19 conditions, the ability to collect accurate new traffic counts is limited. The City of Lathrop approved the use of the projected 2020 intersection turning movement counts from the *2018 Traffic Monitoring Program for The City of Lathrop* for the existing conditions scenario. 2020 freeway mainline volumes were obtained from Caltrans Performance Measurement System (PeMS).

Figure 4 illustrates the existing lane geometry, traffic controls, and volumes at the study intersections. **Figure 5** illustrates the existing a.m. and p.m. peak hour freeway mainline volumes.

3.6 INTERSECTION LEVEL OF SERVICE ANALYSIS – EXISTING CONDITIONS

Existing intersection lane configurations and turning movement volumes are used to calculate the level of service for the study intersections during each peak hour. Existing signal timings at the signalized study intersections were used. The results of the level of service analysis using the Synchro software program for Existing Conditions are summarized in **Table 5**. LOS worksheets are provided in **Appendix B**.

Under this scenario, all of the study intersections operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour.

Table 5: Intersection Level of Service Analysis – Existing Conditions

#	Intersection	Control	Peak Hour ¹	Existing Conditions Delay ²	LOS ³
1	Lathrop Rd/Harlan Rd	Signal	AM	30.6	C
			PM	40.0	D
2	Lathrop Rd/I-5 NB Ramps	Signal	AM	23.9	C

		Stop	PM	N/A	N/A

Notes:

1. AM – morning peak hour, PM – evening peak hour

2. Delay – Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop controlled intersections. Total control delay for the worst movement is presented for side-street stop – controlled intersections.

3. LOS – Level of Service. **Bold** indicates unacceptable LOS and Delay.

3.7 FREEWAY MAINLINE LEVEL OF SERVICE – EXISTING CONDITIONS

The results of the freeway mainline segments level of service along Interstate 5 is summarized in **Table 6**. HCS7 freeway segment reports are attached in **Appendix C**. Under Existing Conditions, all freeway mainline segments operate at LOS D or better during both peak hours.

Table 6: Freeway Segment Level of Service Analysis – Existing Conditions

#	Segment Name	AM Peak Hour		PM Peak Hour

4.0 BASELINE CONDITIONS

This section presents the results of the level of service calculations under Baseline Conditions without the project. Level of service analysis at the study intersections were conducted for Baseline Conditions to establish a baseline to evaluate the impacts due to the addition of traffic from the proposed project. Baseline volumes for the study intersections were referenced from the *2018 Traffic Monitoring Program for The City of Lathrop*. The expected growth in the City of Lathrop between the year 2020 and the year 2022 includes:

- 1,210 new single family residences
- 2,790,350 additional square feet of warehouse/distribution facilities
- 196 hotel rooms
- 326,195 additional square feet of commercial uses

Figure 6 illustrates the Baseline Conditions intersection volumes.

4.1 INTERSECTION LEVEL OF SERVICE ANALYSIS – BASELINE CONDITIONS

The intersection LOS analysis results for Baseline Conditions are summarized in **Table 7**. Detailed calculation sheets for Baseline Conditions are contained in **Appendix D**.

All of the study intersections are projected to operate within the applicable jurisdictional standards during the a.m. and p.m. peak hour except for Lathrop Rd/I-5 NB Ramps during the p.m. peak hour, which is projected to operate at LOS E.

Table 7: Intersection Level of Service – Baseline Conditions

#	Intersection	Control	Peak Hour ¹	Baseline Conditions Delay ²	LOS ³

14	Manthey Rd/Ashley Dwy #3	One-Way	AM	N/A	N/A
		Stop	PM	N/A	N/A
15	Manthey Rd/Ashley Dwy #4	One-Way	AM	N/A	N/A
		Stop	PM	N/A	N/A

Notes:

1. AM – morning peak hour, PM – evening peak hour
2. Delay – Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop controlled intersections. Total control delay for the worst movement is presented for side-street stop – controlled intersections.
3. LOS – Level of Service. **Bold** indicates unacceptable LOS and Delay.

4.2 FREEWAY MAINLINE LEVEL OF SERVICE – BASELINE CONDITIONS

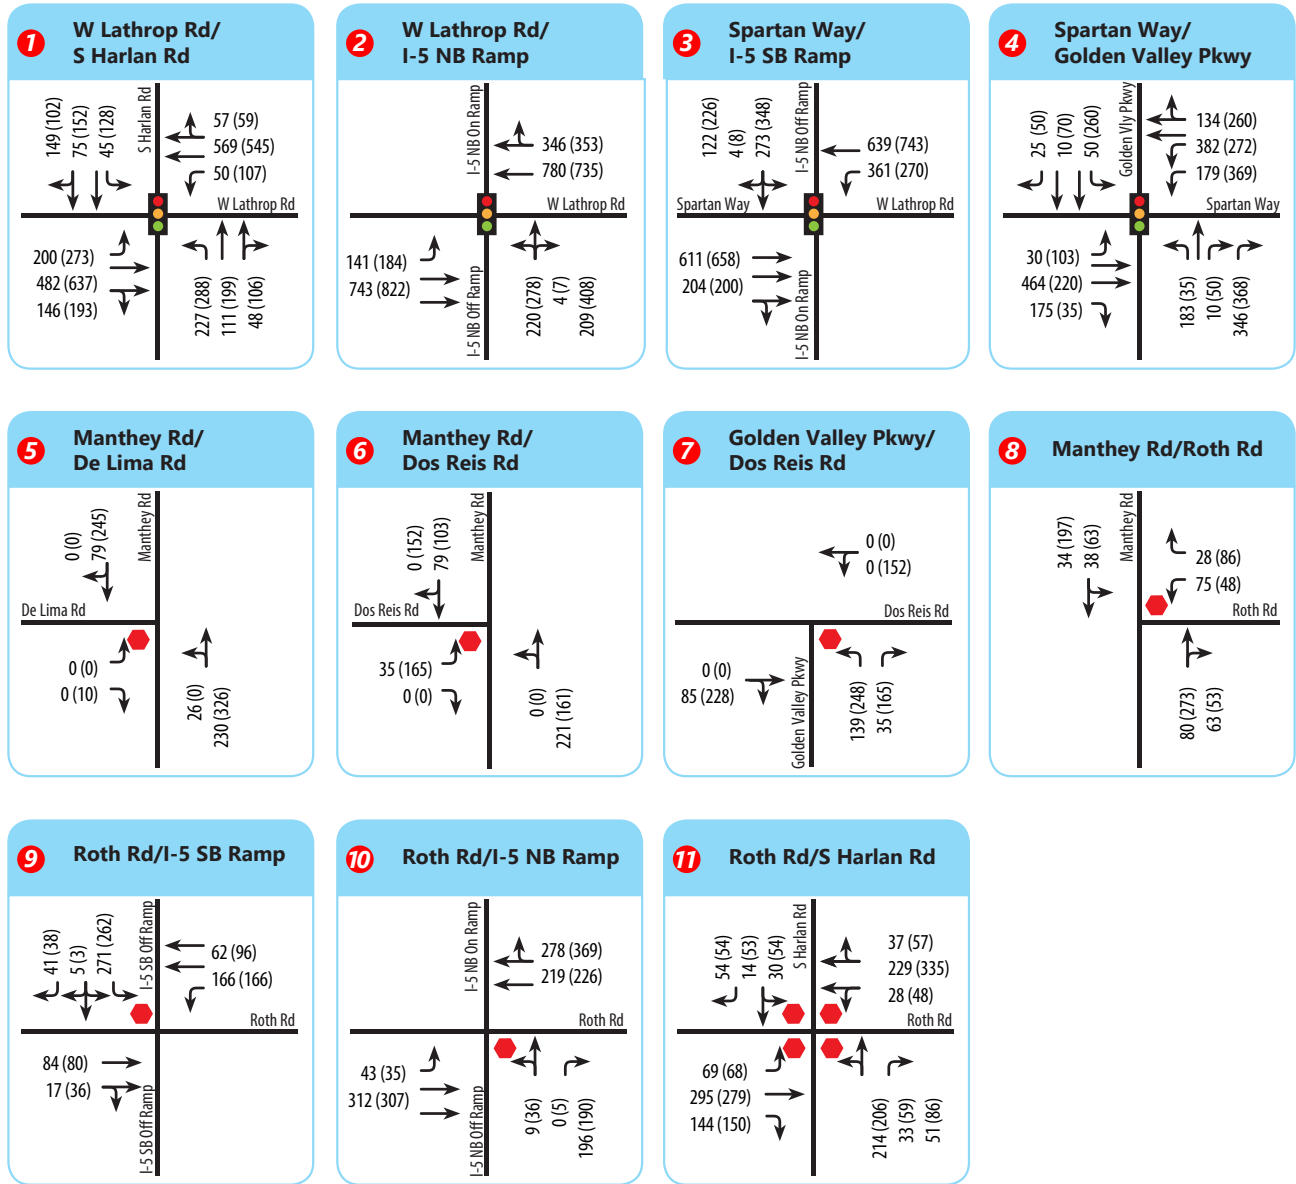

To project the freeway volumes for Baseline Conditions, TJKM used the San Joaquin Council of Governments (SJCOG) Travel Demand Model to develop a.m. and p.m. peak hour growth rates along Interstate 5 in the project vicinity. The growth rates were applied to Existing mainline volumes to project Baseline Conditions. **Figure 7** illustrates the freeway mainline volumes for Baseline Conditions.

The results of the freeway mainline segments levels of service along Interstate 5 are summarized in **Table 8**. HCS7 freeway segment reports are attached in **Appendix E**. Under Baseline Conditions, all freeway mainline segments operate at LOS D or better during both peak hours.

Table 8: Freeway Segment Level of Service Analysis – Baseline Conditions

#	Segment Name	AM Peak Hour		PM Peak Hour	
		Density (pc/mi/ln)	LOS	Density (pc/mi/ln)	LOS

5.0 BASELINE PLUS PROJECT CONDITIONS

This section describes the operational impacts of the proposed project on the transportation system in the immediate project site vicinity. Baseline plus Project Conditions consist of baseline traffic volumes and roadway facilities, plus new traffic generated by the proposed project.

The amount of traffic added to the roadway system by the proposed development is estimated using a three-step process.

- Trip Generation – Estimates the amount of traffic added to the roadway network,
- Trip Distribution – Estimates the direction of travel to and from the project site,
- Trip Assignment – The new trips are assigned to specific street segments and intersection turning movements.

5.1 PROJECT TRIP GENERATION

To determine the amount of peak hour and daily trips generated by the Ashley Furniture Homestore, 24 hour driveway counts were conducted at an existing Ashley Furniture facility located at 18290 S. Harlan Road in Lathrop. The two driveways are exclusively used by customers, employees, and delivery trucks of the Ashley furniture facility. **Appendix F** contains the traffic data collection sheets. **Tables 9** and **10** summarize the trips by passenger vehicles/heavy trucks and the inbound/outbound splits for the existing Ashley facility, respectively.

Table 9: Driveway Counts Summary

<i>Time Period</i>	<i>Cars</i>			<i>Heavy Trucks</i>		
	<i>In</i>	<i>Out</i>	<i>Total</i>	<i>In</i>	<i>Out</i>	<i>Total</i>
AM Peak Hour	43	28	71	5	28	33
PM Peak Hour	38	51	89	11	5	16
Daily	488	491	979	122	116	238

Table 10: Driveway Inbound/Outbound Splits

<i>Time Period</i>	<i>Cars</i>		<i>Trucks</i>	
	<i>In</i>	<i>Out</i>	<i>In</i>	<i>Out</i>
AM Peak Hour	61%	39%	15%	85%
PM Peak Hour	43%	57%	69%	31%
Daily	50%	50%	51%	49%

The approximate square footage of the existing Ashley facility is 525,000 square foot. With this information and data collection, approximate trip rates were developed for passenger vehicles and heavy trucks. **Table 11** summarizes the daily, a.m. peak hour, and p.m. peak hour trip rates for passenger vehicles. **Table 12** summarizes the daily a.m. peak hour, and p.m. peak hour trip rates for heavy trucks.

Table 11: Passenger Vehicle Trip Rates

<i>Time Period</i>	<i>Rate (Trips/1000 s.f.)</i>
Daily Passenger Vehicles	1.865
AM Peak Hour Passenger Vehicles	0.135
PM Peak Hour Passenger Vehicles	0.170

Table 12: Heavy Vehicle Trip Rates

<i>Time Period</i>	<i>Rate (Trips/1000 s.f.)</i>
Daily Heavy Trucks	0.453
AM Peak Hour Heavy Trucks	0.063
PM Peak Hour Heavy Trucks	0.030

The proposed Ashley Furniture is projected to generate 2,798 daily passenger vehicles, 203 a.m. peak hour passenger vehicles, and 255 p.m. peak hour passenger vehicles. The proposed Ashley Furniture is projected to generate 680 daily heavy trucks, 95 a.m. peak hour trucks, and 45 p.m. peak hour trucks. It should be noted that the current plan is to restrict heavy truck operations by requiring trucks to use the Roth Road interchange at all times. **Table 13** and **Table 14** summarizes the trip generation for passenger vehicles and heavy trucks, respectively.

Table 13: Project Trip Generation for Passenger Vehicles

	<i>Size</i>	<i>Daily</i>		<i>A.M. Peak</i>				<i>P.M. Peak</i>					
		<i>Rate</i>	<i>Trips</i>	<i>Rate</i>	<i>In:Out</i>	<i>In</i>	<i>Out</i>	<i>Total</i>	<i>Rate</i>	<i>In:Out</i>	<i>In</i>	<i>Out</i>	<i>Total</i>
Proposed Uses													
Ashley Furniture	1,500 ksf	1.87	2,798	0.135	61:39	124	79	203	0.170	43:57	110	145	255

Net Trips			680			14	81	95			31	14	45

5.2 PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

Trip distribution is a process of developing study assumptions that estimates the direction vehicular trips will arrive and depart the study site. Trip assignment estimates specific streets and turning movements at study intersections for project-related or site traffic. Trip distribution assumptions for the proposed project are developed based existing travel patterns and knowledge of the study area. **Figure 8** and **Figure 9** illustrate the trip distribution and trip assignment for passenger vehicles, respectively. **Figure 10** and **Figure 11** illustrate the trip distribution and trip assignment for heavy trucks, respectively.

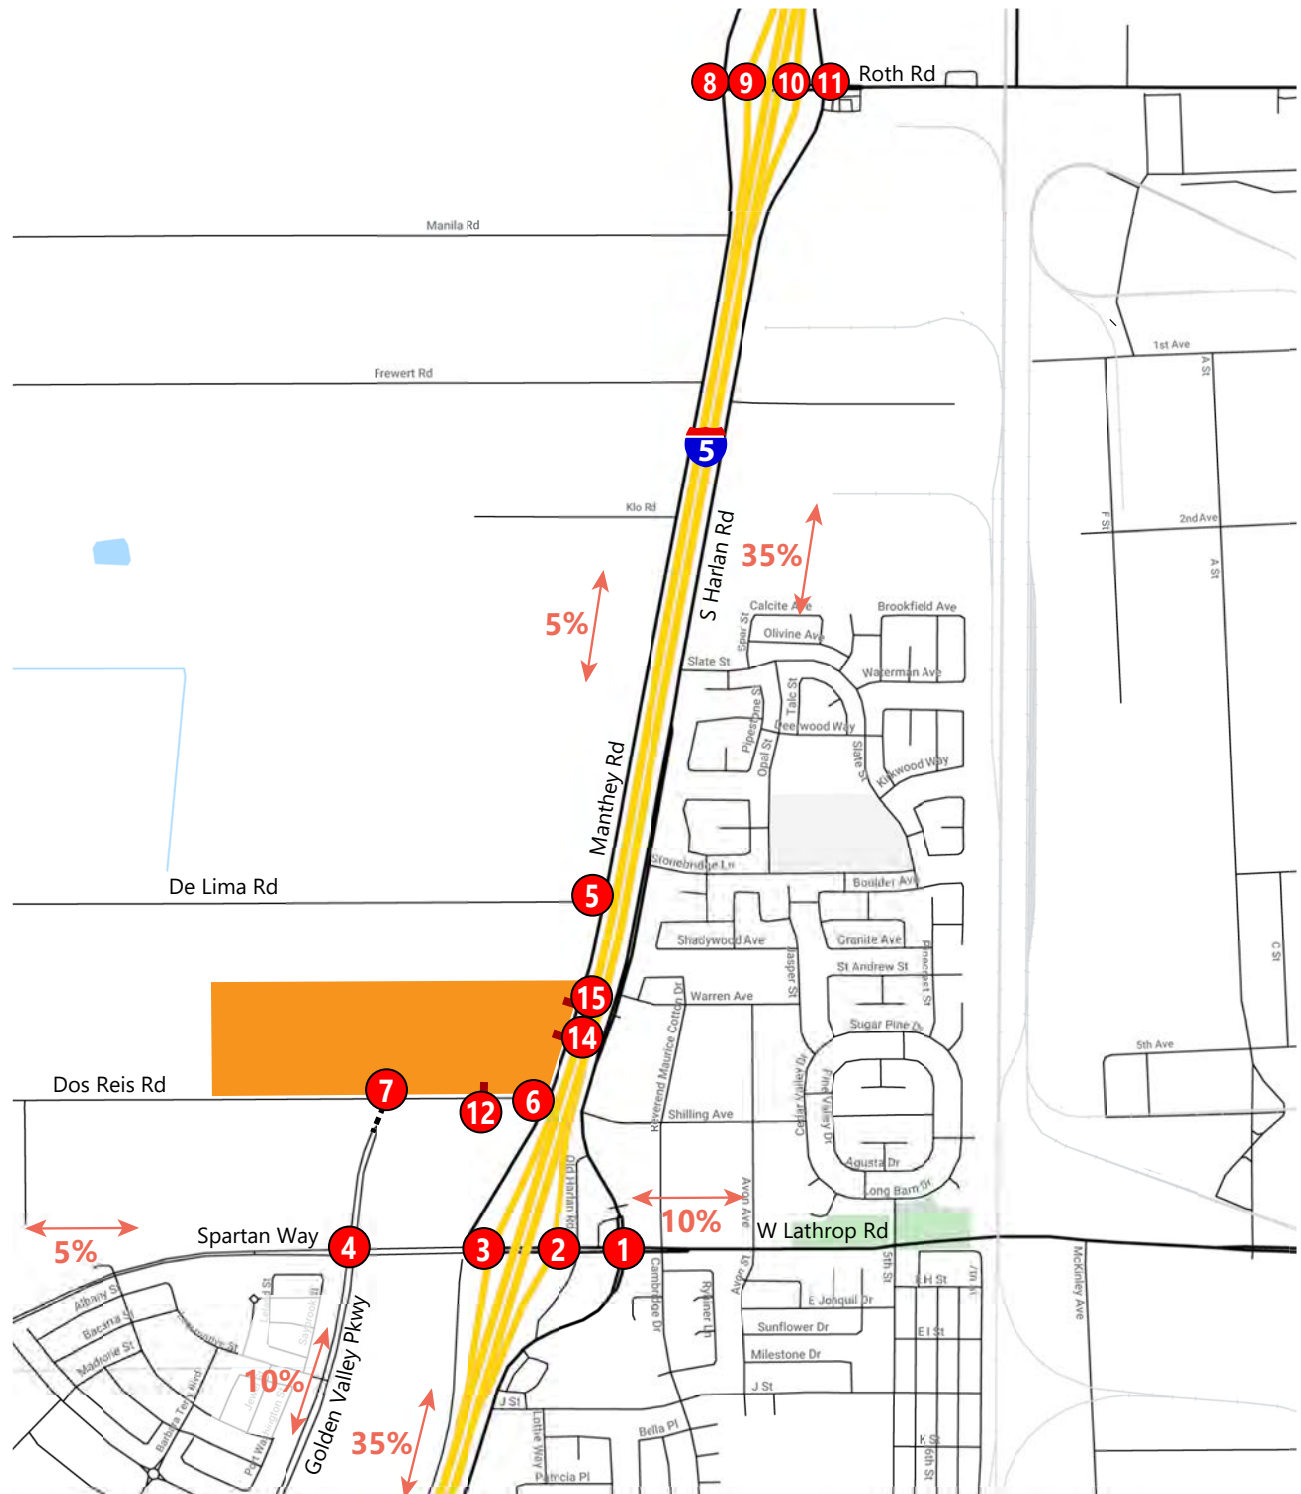

Trip distribution for passenger vehicles is as follows:

- 35 percent to/from Interstate 5, south of Lathrop Road;
- 35 percent to/from Interstate 5 north of Lathrop Road;
- 10 percent to/from Lathrop Road, east of Interstate 5;
- 10 percent to/from Golden Valley Parkway, south of Spartan Way;
- 5 percent to/from Spartan Way, west of Golden Valley Parkway; and
- 5 percent to/from Manthey Road, north of project site.

Trip distribution for heavy trucks is as follows:

- 45 percent to/from Interstate 5, north of Roth Road;
- 45 percent to/from Interstate 5, south of Roth Road; and
- 10 percent to/from Roth Road, east of Interstate 5.

5.3 INTERSECTION LEVEL OF SERVICE ANALYSIS – BASELINE PLUS PROJECT CONDITIONS

The intersection level of service analysis results for Baseline plus Project Conditions are summarized in **Table 15**. The results for Baseline Conditions are included for comparison purposes. Detailed calculation sheets for Baseline Plus Project Conditions are contained in **Appendix G. Figure 12** displays projected peak hour turning movement volumes at all of the study intersections for Baseline plus Project Conditions.

Under this scenario, all but three of the study intersections would continue to operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour. The following intersection already operates at unacceptable level of service without the addition of project traffic.

- Lathrop Rd/I-5 NB Ramps (Intersection #2) degrades to LOS F in the p.m. peak hour, with an increase in average delay of 19.1 seconds.

The following two intersections would degrade from acceptable to unacceptable level of service with the addition of project traffic:

- Lathrop Rd-Spartan Way/I-5 SB Ramps (Intersection #3) would degrade from LOS D to LOS E in the a.m. and p.m. peak hour, a *substantial degradation*.
- Spartan Way/Golden Valley Pkwy (Intersection #4) would degrade from LOS C to LOS E in the a.m. peak hour and LOS D to LOS F in the p.m. peak hour, a *substantial degradation*.

At the three intersections listed above, added project traffic would either degrade the level of service from acceptable to unacceptable, or increase average delay by more than 5.0 seconds, constituting *inconsistencies* with the City of Lathrop standards.

Table 15: Intersection Level of Service Analysis – Baseline plus Project Conditions

#	Study Intersections	Control	Peak Hour ¹	Baseline Conditions		Baseline Plus Project Conditions	
				Delay ²	LOS ³	Delay ²	LOS ³

Notes:

1. AM – morning peak hour, PM – evening peak hour
2. Delay – Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop controlled intersections. Total control delay for the worst movement is presented for side-street stop – controlled intersections.
3. LOS – Level of Service. **Bold** indicates unacceptable Level of Service.

5.3.1 Baseline plus Project Recommended Improvements

The City of Lathrop is in the process of planning the improvement of the Lathrop Road/I-5 Interchange by widening Lathrop Road to three lanes in each direction, constructing new southbound loop on-ramps, and widening off-ramps with new signalized intersections. This major improvement project is not funded or scheduled at this time, although it is included in the current Capital Improvement Plan (CIP). The Ashley project is expected to fund its fair share of the project by payment of local and regional development fees, as discussed further in Section 7.1.1, consistent with the City of Lathrop General Plan and the City's efforts to achieve an acceptable level of service at the Lathrop Road/I-5 Interchange.

While the Lathrop Road Interchange project can be considered a cumulative improvement, the City of Lathrop is considering widening the northbound off-ramp to provide an additional turn lane as an interim measure as of the 2022 Transportation Monitoring Plan (TMP). For the Lathrop Road/I-5 NB Ramps, the addition of a separate right-turn lane for the off-ramp and signal timing optimization will improve the intersection operation to LOS C in the a.m. and p.m. peak hours, which is consistent with the City of Lathrop General Plan. Based on 95th percentile queue lengths, the new lane should provide at least 400 ft. of storage.

In order to assess the feasibility of widening the northbound off-ramp as proposed, TJKM reviewed the future configuration of the Lathrop Road interchange as shown in the current CIP. Based on the CIP, it appears that although the southbound ramps would be repositioned and reconfigured, the northbound off-ramp would only be widened. It may be possible to construct an interim widening of this ramp, as proposed here and in the TMP, while remaining consistent with the ultimate configuration.

For the Lathrop Road/I-5 SB Ramps, signal timing adjustments will improve the intersection operation to LOS D in the a.m. and p.m. peak hour, which is consistent with the City of Lathrop General Plan and the City's efforts to achieve an acceptable level of service at the Lathrop Road/I-5 Interchange. Widening is not necessary for Baseline plus Project Conditions at the southbound off-ramp, although it is recommended in the 2022 TMP.

For Spartan Way/Golden Valley Parkway, the following lane geometry is recommended:

- NB approach: one left-turn lane, one through lane, two right-turn lanes.
- SB approach: two left-turn lanes, two through lanes, one right-turn lane.
- EB approach: one left-turn lane, two through lanes, one right-turn lane.
- WB approach: two left-turn lanes, two through lanes, one right-turn lane.

These changes can be accomplished through restriping existing pavement. Also, optimizing the signal timings at the intersection is projected to improve operations to LOS D in the a.m. and p.m. peak hours, with a delay of 48.5 seconds and 52.9 seconds, respectively, which is consistent with the City of Lathrop General Plan. The intersection LOS sheets with recommendations are included in **Appendix G**.

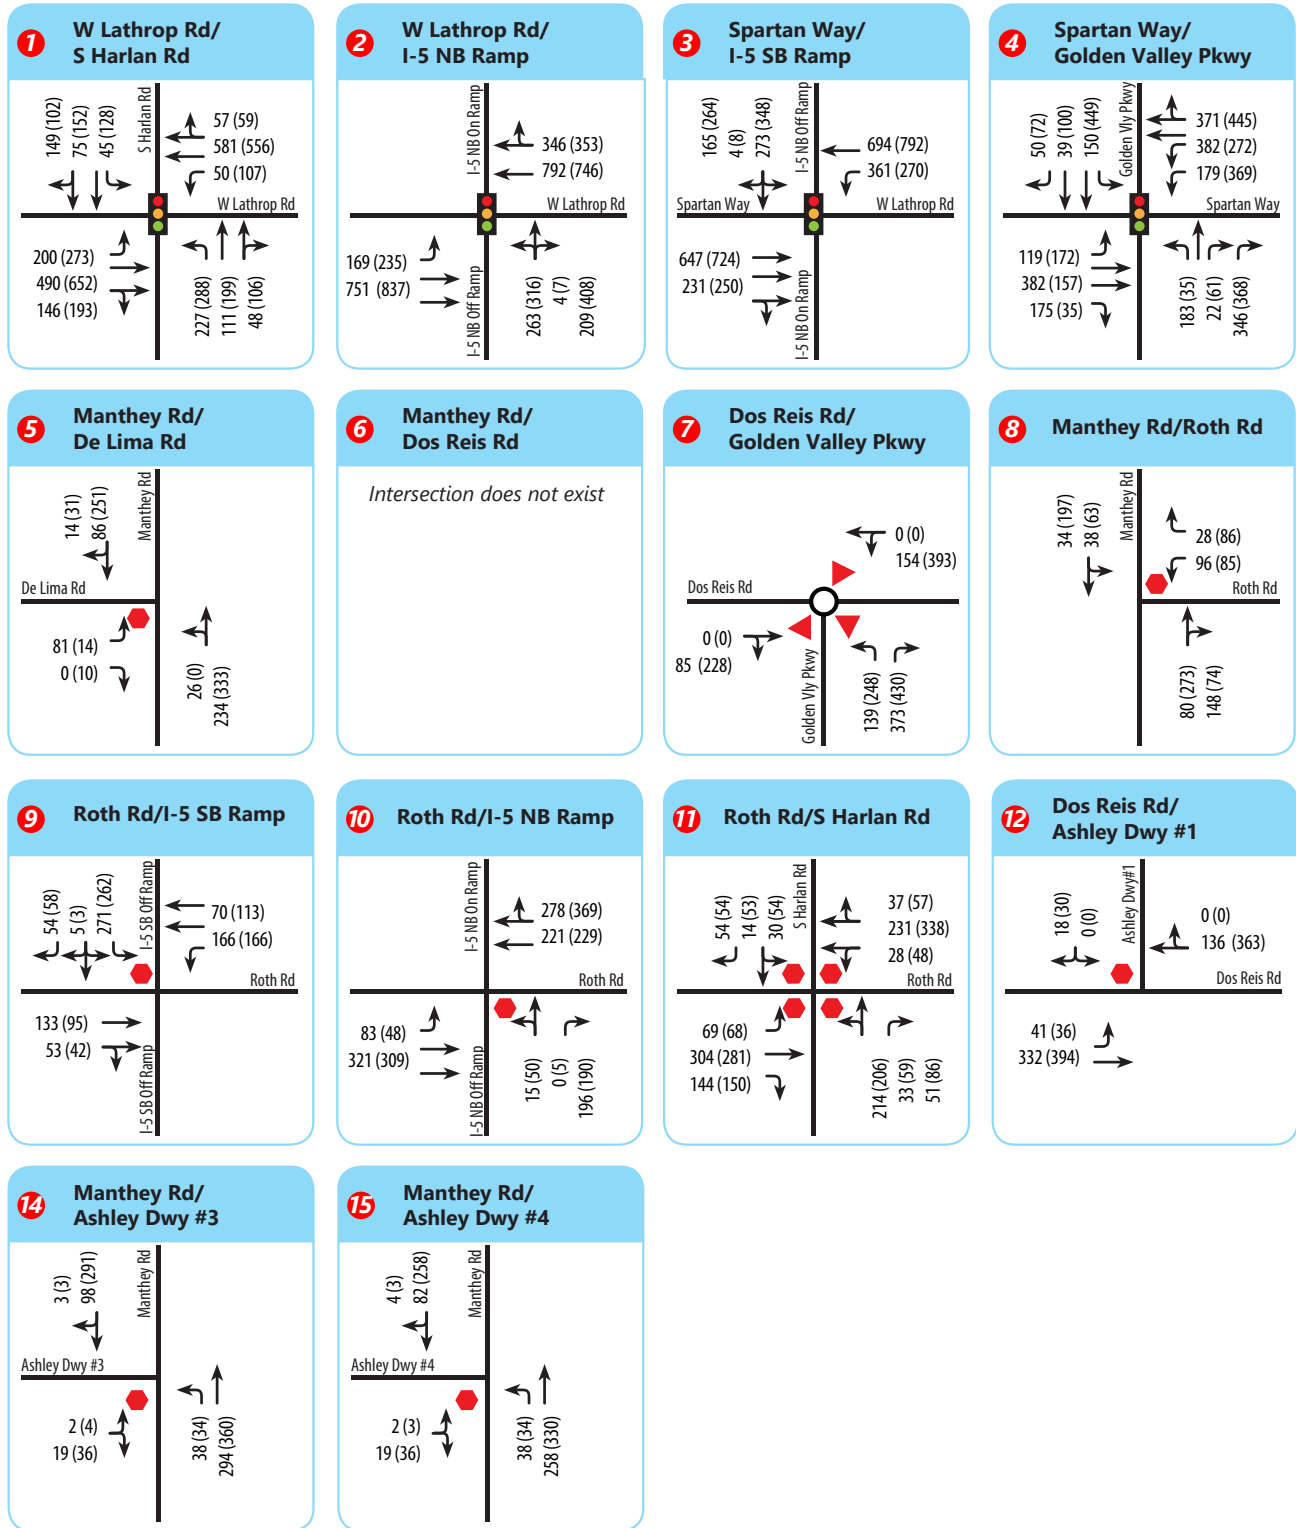

5.4 FREEWAY MAINLINE LEVEL OF SERVICE – BASELINE PLUS PROJECT

The results of the freeway mainline segments level of service along Interstate 5 is summarized in **Table 16**. HCS7 freeway segment reports are attached in **Appendix H. Figure 13** illustrates the Baseline plus Project freeway mainline volumes. Under Baseline plus Project Conditions, all freeway mainline segments operate at LOS D or better during both peak hours.

Table 16: Freeway Segment Level of Service Analysis – Baseline plus Project Conditions

#	Segment Name	Baseline Conditions				Baseline plus Project

6.0 CUMULATIVE CONDITIONS

This section presents the results of the level of service calculations under Cumulative Conditions without the project. Cumulative plus Project Conditions traffic volumes were modeled by Fehr & Peers as part of the *Roth Road Improvement Study*, currently in progress, in coordination with City of Lathrop staff. The volumes from the *Roth Road Improvement Study* accounted for future conditions with the construction of the Ashley project. As such, Project trips were deducted to estimate Cumulative (no project) Conditions. Cumulative Conditions represent estimated 2040 traffic volumes. Although improvements are planned on Roth Road and Lathrop Road, for the purposes of this analysis, lane geometry, traffic controls, and other parameters are identical to Baseline Conditions. A peak hour factor of 1.0 is assumed for all intersections.

6.1 INTERSECTION LEVEL OF SERVICE ANALYSIS – CUMULATIVE CONDITIONS

The intersection LOS analysis results for Cumulative Conditions are summarized in **Table 17**. Detailed calculation sheets for Baseline Conditions are contained in **Appendix I**. **Figure 14** displays projected peak hour turning movement volumes at all of the study intersections for Cumulative Conditions.

Under this scenario, seven of the study intersections are projected to operate below applicable jurisdictional standards during one or both peak hours. Three intersections at or near the Lathrop Road/I-5 interchange and four intersections at or near the Roth Road/I-5 interchange would operate at LOS F during one or both peak hours. The remaining intersections would operate within applicable standards during the a.m. and p.m. peak hours.

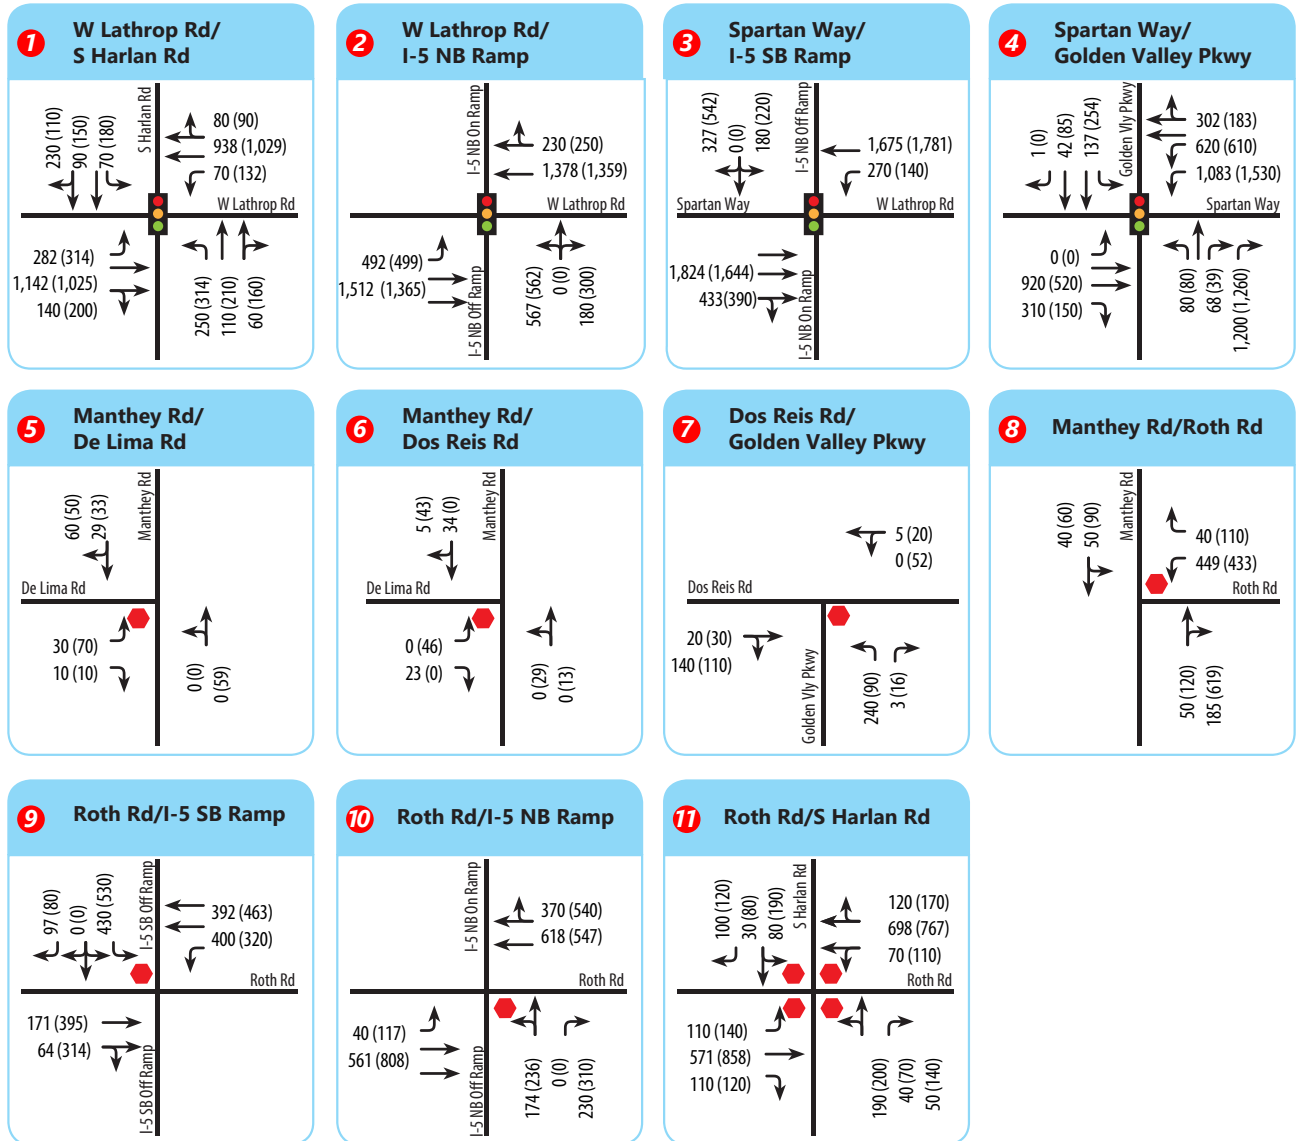

Table 17: Intersection Level of Service – Baseline Conditions

#	Intersection	Control	Peak Hour ¹	Cumulative Conditions Delay ²	LOS ³

7.0 CUMULATIVE PLUS PROJECT CONDITIONS

This section presents the results of the level of service calculations under Cumulative Conditions. Cumulative plus Project Conditions traffic volumes were modeled by Fehr & Peers as part of the *Roth Road Improvement Study*, currently in progress, in coordination with City of Lathrop staff. Although improvements are planned on Roth Road and Lathrop Road, for the purposes of this analysis, lane geometry, traffic controls, and other parameters are identical to Baseline Conditions. A peak hour factor of 1.0 is assumed for all intersections.

7.1 INTERSECTION LEVEL OF SERVICE ANALYSIS – CUMULATIVE PLUS PROJECT CONDITIONS

The intersection level of service analysis results for Cumulative plus Project Conditions are summarized in **Table 18**. The results for Cumulative Conditions are included for comparison purposes. Detailed calculation sheets for Cumulative Plus Project Conditions are contained in **Appendix J. Figure 15** displays projected peak hour turning movement volumes at all of the study intersections for Cumulative plus Project Conditions.

Under this scenario, seven of the study intersections are projected to continue to operate below applicable jurisdictional standards during one or both peak hours. Three intersections at or near the Lathrop Road/I-5 interchange and four intersections at or near the Roth Road/I-5 interchange would operate at LOS F during one or both peak hours. The remaining intersections would operate within applicable standards during the a.m. and p.m. peak hours.

At the seven intersections operating below jurisdictional standards, added project traffic would either degrade the level of service from acceptable to unacceptable, or increase average delay by more than 5.0 seconds, constituting *inconsistencies* with the City of Lathrop standards.

			PM	N/A	N/A	10.4	B

Notes:

1. AM – morning peak hour, PM – evening peak hour
2. Delay – Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop controlled intersections. Total control delay for the worst movement is presented for side-street stop – controlled intersections.
3. LOS – Level of Service. **Bold** indicates unacceptable Level of Service.

7.1.1 Fair Share Analysis

The City of Lathrop is in the process of planning the improvement of both the Lathrop Road/I-5 Interchange and the Roth Road/I-5 Interchange. These interchange projects consist of Intersections #1-4 and 8-11, respectively.

At the direction of City of Lathrop staff, a fair share analysis was conducted for impacted intersections and intersections that are part of both interchange projects. “Fair Share” is defined as the percent contribution of project traffic to the growth from Existing Conditions to Cumulative plus Project Conditions. **Table 19** shows the fair share for a.m. plus p.m. peak hour volumes at these eight intersections. As it is expected that interchange improvements will be identified and funded prior to 2040, no interim improvement measures are recommended at those locations for this scenario.

At the Lathrop Road/I-5 interchange, individual intersection fair share percentages range from one percent to six percent (5.1 percent overall). At the Roth Road/I-5 interchange, individual intersection fair share percentages range from one percent to nine percent (4.5 percent overall).

The Ashley project is expected to fund its fair share of the interchange project costs by payment of local and regional development fees, consistent with the City of Lathrop General Plan policies and the City’s efforts to achieve an acceptable level of service.

Table 19: Fair Share Analysis

#	<i>Study Intersections</i>	<i>Existing A</i>	<i>Project Trips B</i>	<i>Cumulative plus Project C</i>	<i>Cumulative Growth D = C-A</i>	<i>Fair Share B/D</i>
1	Lathrop Rd/ Harlan Rd	4,525	46	7,422	2,897	1.6%
2	Lathrop Rd/ I-5 NB Ramps	4,488	206	8,900	4,412	4.7%
3	Lathrop Rd-Spartan Way/I-5 SB Ramps	3,620	364	9,790	6,170	5.9%
4	Spartan Way/Golden Valley Parkway	2,645	434	9,903	7,258	6.0%
Lathrop Rd/I-5 Interchange (Total)		15,278	1,050	36,015	20,737	5.1%

8.0 ADDITIONAL ANALYSES

The following sections provide additional analyses of other transportation issues associated with the project site, including:

- Vehicle Miles Traveled,
- Site Access,
- On-site Circulation,
- Truck Operations,
- Parking, and
- Pedestrian, Bicycle, and Transit Impacts

Unlike the LOS impact methodology, the analyses in these sections are generally based on professional judgment in accordance with the standards and methods employed by traffic engineers. However, Vehicle miles traveled (VMT) is evaluated as a CEQA impact. Although operational issues are not considered CEQA impacts, they do describe traffic conditions that are relevant to the project environment.

8.1 VEHICLE MILES TRAVELED (VMT)

As previously mentioned, the San Joaquin County Transportation Analysis Guidelines (September 2020) were used. On page 14, the guidelines recommend that the estimated VMT for a proposed project be obtained by inserting the proposed project into the San Joaquin COG 2018 RTP Model. Since the project is not screened out from the maps in the SJ County Transportation Analysis guidelines, a base year plus project model run was performed.

The Ashley Furniture project is located in TAZ #1744 of the SJCOG model. Currently, TAZ #1744 has five employees coded. The project will add a total of 1,295 employees. There are three types of employment in this project; warehouse, office, and retail. From the project’s Site Plan, there are 1,400,000 square feet of warehouse, 25,000 square feet of office, and 100,000 square feet of retail. The Southern California Council of Governments (SCAG) employment density study finds that there are a median of 1,225 square feet per employee for warehouses, 466 square feet per employee for offices, and 1,023 square feet per employee for regional retail. Thus, it is expected that 1,143 new employees will come from the warehouse, 98 employees from the office, and 54 employees for the retail portion. **Table 20** shows the land use changes for the base year with project model run.

Table 20: Land Use Changes for Base Year

<i>TAZ</i>	<i>Employees (Industrial Land Use)</i>	<i>Employees (Office Land Use)</i>	<i>Employees (Retail Land Use)</i>	<i>Total Employees</i>
1744	+1,143	+98	+54	+1,295

1,295 employees in the industrial land use category (which is what the SJCOG model uses for warehouses) was added in TAZ #1744 and the project year traffic model was rerun. The results are summarized in **Table 21**.

Table 21: VMT per Employee Comparison

<i>TAZ</i>	<i>Base Year Average Daily VMT per Employee (per SJCOG Model)</i>	<i>Regional Average (per SJCOG Model)</i>	<i>15% Below Regional Average (per SJCOG Model)</i>	<i>Base Year Plus Project Average Daily VMT per Resident (per Model run)</i>
1744	10.48	19.1	16.2	15.43

The base year average daily VMT per employee for TAZ #1744 is 10.48. Adding in the project’s 1,295 employees brought the daily VMT per employee to 15.43, an increase of 4.95. These numbers are reasonable since the project’s location is in relative close proximity to the residential districts of Lathrop, and also brings much needed jobs into an area that has very little employment.

The project’s 15.43 daily VMT per employee is lower than the San Joaquin County VMT threshold of 16.2. VMT impacts for the Ashley Furniture Homestore project are found to be **less-than-significant** for the base year, and thus no mitigation is required for VMT impacts attributable to this project.

8.2 SITE ACCESS

The project site plan dated March 29, 2023 is shown in **Figure 2**. The proposed Ashley Furniture includes various drive aisles that allow for circulation throughout the development. Drive aisles for the passenger vehicle parking spaces are approximately 26-36 feet wide. Drive aisles for heavy trucks (larger than SU-30) are 60-72 feet wide, according to the project site plan. The south driveway (Intersection #12) is a full access driveway, 40 feet wide, which accommodates two-way entry. The driveway for Intersection #14 is a full access driveway, approximately 40 feet wide. The driveway for Intersection #15 is also a full access driveway, however this driveway is dedicated for truck traffic only and would be approximately 70 feet wide. Heavy trucks will be restricted to only using this driveway on Manthey Road and would generally be restricted to using the I-5/Roth Road interchange.

The site plan includes the proposed lane geometry on Manthey Road and Dos Reis Road, including the installation of raised medians. Based on overall project design, driveway locations and access restrictions are appropriate. Any proposed landscaping should be maintained in order to maintain sight distance to and from the driveways. The proposed driveway locations, design, and sight distance are all **adequate**.

8.3 ON-SITE CIRCULATION

As shown in **Figure 2**, the project site plan includes multiple drive aisles. These drive aisles connect to individual parking areas located throughout the project site. Sight lines appear to be clear at internal intersections. Landscaping should be maintained periodically to provide adequate sight distance.

Drive aisles in the parking areas are typically 26-36 feet wide, with two-way travel and perpendicular parking throughout the site. Drive aisles can accommodate emergency vehicles throughout the site. Trash enclosures are located to the north and south of the site.

The site plan shows all proposed pedestrian facilities on the project frontage and connectivity from Manthey Road to the retail showroom entrance. The project site plan does show four crosswalks connecting the

passenger vehicle parking lot to the retail showroom. The site plan shows two bike rack locations, one on the south side of the building and one on the east side.

The internal circulation for the project is considered **adequate**.

8.4 TRUCK OPERATIONS

The proposed Ashley furniture is proposing to restrict heavy trucks (larger than SU-30) from using the Lathrop Road/I-5 interchange at all times to alleviate potential congestion at those intersections. Instead, trucks will be using the Roth Road/I-5 interchange and head south on Manthey Road to access the Ashley Furniture site via the northernmost driveway only. Only local delivery trucks would be permitted on Dos Reis Boulevard and Golden Valley Parkway. Based on the level of service analysis, additional truck traffic on the Roth Road intersections is not expected to degrade the LOS to unacceptable operations.

8.5 PARKING

According to the City of Lathrop Municipal code (Chapter 17.76 Off-Street Parking and Loading), the project is required to provide the following parking spaces:

- One space per 400 square feet of floor area for office uses.
- One space per 600 square feet of floor area for retail stores that primarily handle bulky merchandise such as furniture.
- One space per 2,000 square feet of floor area for warehouse uses.

Based on the City requirements, the project is required to provide 60 stalls for office uses, 184 stalls for retail uses, and 649 stalls for warehouse uses. This amounts to a total of 893 stalls of parking the project is required to provide. For parking lots providing 501-1000 parking spaces, the Americans with Disabilities Act (ADA) requires that at least two percent must be accessible. The project is proposing to provide a total of 942 stalls, including 20 total accessible spaces. A breakdown is as follows:

- 722 standard spaces (9'x20');
- 19 accessible spaces (9'x20');
- Six van accessible spaces (12'x20');
- 145 electric vehicle (EV) capable spaces (9'x20');
- 38 electric vehicle charging station (EVCS) standard spaces (9'x20');
- Two EVCS van accessible spaces (12'x20');
- Five EVCS standard accessible spaces (9'x20'); and
- Five EVCS ambulatory spaces (10'x20').

The project is also providing 1,104 trailer stalls (ranging from 12' x 30' to 12' x 53') for its own operations. The proposed project satisfies the City and ADA parking requirements.

8.6 PEDESTRIAN, BICYCLE, AND TRANSIT IMPACTS

Pedestrian Access

Pedestrian access to the project site is facilitated by new sidewalks along Dos Reis Road and Manthey Road, paved walkway within the parking lot and crosswalks. The proposed development project does not conflict

with existing and planned pedestrian facilities; therefore, the impact to pedestrian facilities is ***less than significant***.

Bicycle Access

As shown in **Figure 3**, there are no existing bicycle facilities on De Lima Road, Manthey Road and Dos Reis Road. If the project proposes bicycle facilities, it should show them on future site plans. The project does not conflict with existing and planned bicycle facilities; therefore, the impact to bicycle facilities is ***less than significant***.

Transit Access

The project site is within a 3/4 mile of two San Joaquin RTD bus stops, located on the northwest corner of Lathrop Road/Harlan Road and in front of the Save Mart. Due to the lack of development north of Spartan Way, there are sidewalk gaps from the proposed project site to the bus stops. As development in the area increases, sidewalks should be installed to close the gap in pedestrian facilities. Impacts to transit service are expected to be ***less than significant***.

Appendix A –Level of Service Methodology

TECHNICAL MEMORANDUM

Subject: Highway Capacity Manual – Level of Service Definitions

The purpose of this memorandum is to define level of service (LOS) and the procedures for its calculation.

LOS is commonly used as a measure of effectiveness (MOE) / quality of service (QOS) for traffic. The procedures for LOS determination and calculation are found within the Transportation Research Board’s (TRB) *Highway Capacity Manual* (HCM), 6th Edition. MOE / QOS generally consist of quantitative metrics to characterize operational conditions within a traffic stream. LOS is a measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience.

Six levels of service are defined for each facility type that has procedures available. Alphabetical letters designated each grade from A to F. LOS A represents the best operating conditions; LOS F represents the worst operating conditions. Each LOS represents a range of operating conditions and drivers’ perceptions of those conditions. Safety is not included in the measure to establish service level.

A general description of LOS for every types of roadway facilities is shown in **Table 1**.

Table 1: General LOS by Facility Type

	Uninterrupted Flow	Interrupted Flow
Facility Example Types		
	Freeways	Signalized intersections
	Multi-lane highways	Two-way stop controlled intersections
	Two-lane highways	All-way stop controlled intersections
	Urban Streets	Roundabouts
LOS Character		
A	Free flow.	Very low delay.
B	Stable flow. Presence of other users noticeable.	Low delay.
C	Stable flow. Comfort and convenience starts to decline.	Moderate delay
D	High density stable flow.	Acceptable delay
E	Unstable flow.	Limit of acceptable delay,
F	Forced or breakdown flow.	Unacceptable delay.

Signalized Intersections

Signalized intersection LOS is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection, and control delay experienced by each vehicle. LOS can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach; control delay and volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. Delay quantifies the increase in travel time due to traffic signal control; it is also a surrogate measure of driver discomfort and fuel consumption. The v/c ratio quantifies the degree to which a phase's capacity is utilized by a lane group. A v/c ratio of 1.0 or more indicates cycle capacity is fully utilized and represents failure from a capacity perspective (just as delay in excess of 80 sec/veh represents failure from a delay perspective). The detailed methodology for determining LOS at signalized intersection is presented in Chapter 19 of the HCM. The LOS for signalized intersections are defined in **Table 2**.

Table 2: Signalized LOS Summary

LOS	Definition	Control Delay Range (s/veh)	v/c Range
A	Very low control delay. This level is typically assigned when the v/c ratio is low and either progression is exceptionally favorable or the cycle length is short. Most vehicles arrive during the green phase. Many vehicles do not stop at all.	≤ 10	≤ 1.0
B	The v/c ratio is low. There is good progression, short cycle lengths, or both. More vehicles stop, causing higher levels of delay.	≤ 20	≤ 1.0
C	Higher delays occur in favorable progression or a due to a moderate cycle length, or both. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during a given cycle) may begin to appear. The number of vehicles stopping is still considered low-to-moderate, though many vehicles still pass through the intersection without stopping.	≤ 35	≤ 1.0
D	The influence of congestion becomes more apparent. Longer delays may result from some combination of a high v/c ratio, ineffective progression, long cycle length, or high volumes. Many vehicles stop, the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	≤ 55	≤ 1.0
E	Typically considered the limit of acceptable delay. High delays usually indicate a very high v/c ratio, poor progression, long cycle lengths, and high volumes. Most cycles fail to clear the queue.	≤ 80	≤ 1.0
F	Delays are unacceptable to most drivers. Conditions are considered oversaturated. Arrival flow rates exceed the capacity of the intersection (v/c in excess of 1.0). Many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to higher delay.	> 80	> 1.0

Two-Way Stop Controlled Intersections

At two-way stopped controlled (TWSC) intersections, LOS is not defined for the intersection as a whole or for major-street approaches for three primary reasons:

1. The major-street through and right-turning traffic are assumed to experience zero delay as traffic progression operates unimpeded;
2. The disproportionate number of major-street through traffic at a typical TWSC intersection skews the weighted average of all movements, resulting in very low overall average delay for all vehicles, and
3. The resulting low delay can mask LOS deficiencies for minor movements.

The LOS for the minor street and the mainline left-turn traffic are dependent on the volume and capacity of the available lanes, and the number and frequency of acceptable gaps in the major street traffic to make a conflicting turn. The LOS grade is provided for all conflicting movements at an intersection and is based on the total average control delay experienced by each vehicle and the lane group volume-to-capacity (v/c) ratios. The delay includes the time it takes a vehicle to move from the back of a queue through the intersection. The detailed methodology for determining LOS at TWSC intersection is presented in Chapter 20 of the HCM. The TWSC LOS descriptions are provided in **Table 3**.

Table 3: TWSC LOS Summary

LOS	Definition	Control Delay Range (s/veh)	v/c Range
A	Usually no conflicting traffic. Drivers can easily find gaps in traffic to maneuver. v/c is low.	≤ 10	≤ 1.0
B	Occasionally some delay due to conflicting traffic. Drivers can find gaps in traffic. v/c is low.	≤ 15	≤ 1.0
C	There is some noticeable delay due to conflicting traffic. Drivers are still able to find gaps in traffic.	≤ 25	≤ 1.0
D	Drivers experience delay due to less gaps in traffic to maneuver. Lane group v/c creeps closer to 1.0.	≤ 35	≤ 1.0
E	Delay approaches driver tolerance levels. Drivers will occasionally find gaps in traffic to maneuver. Lane group v/c approaches 1.0.	≤ 50	≤ 1.0
F	Delay exceed driver tolerance levels or v/c exceeds 1.0 or both.	> 50	> 1.0

All-Way Stop Controlled and Roundabout Intersections

All-way stopped controlled (AWSC) intersections and roundabout intersections are based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection, and control delay. LOS can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach; control delay and volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. The delay includes the time it takes a vehicle to move from the back of a queue through the intersection. A v/c ratio of 1.0 represents failure from a capacity perspective (just as delay in excess of 80 sec/veh represents failure from a delay perspective).

The detailed methodology for determining LOS at AWSC and roundabout intersection are presented in Chapter 21 and Chapter 22 respectively in the HCM. The AWSC and roundabout LOS descriptions are shared and are provided in **Table 4**.

Table 4: AWSC and Roundabout LOS Summary

LOS	Definition	Control Delay Range (s/veh)	v/c Range
A	Usually no conflicting traffic. Drivers can easily find gaps in traffic to maneuver. v/c is low.	≤ 10	≤ 1.0
B	Occasionally some delay due to conflicting traffic. Drivers can find gaps in traffic. v/c is low.	≤ 15	≤ 1.0
C	There is some noticeable delay due to conflicting traffic. Drivers are still able to find gaps in traffic.	≤ 25	≤ 1.0
D	Drivers experience delay due to less gaps in traffic to maneuver. Lane group v/c creeps closer to 1.0.	≤ 35	≤ 1.0
E	Delay approaches driver tolerance levels. Drivers will occasionally find gaps in traffic to maneuver. Lane group v/c approaches 1.0.	≤ 50	≤ 1.0
F	Delay exceed driver tolerance levels or v/c exceeds 1.0 or both.	> 50	> 1.0

*** AERMOD - VERSION 19191 *** *** C:\Users\Smith\Dropbox\My PC (DESKTOP-977GSBU)\Documents\HRA\Ashley *** 07/19/23

*** AERMET - VERSION 18081 *** *** 15:03:05

*** MODELOPTs: NonDEFAULT CONC FLAT RURAL ADJ_U*

*** MODEL SETUP OPTIONS SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses RURAL Dispersion Only.

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.

**Other Options Specified:

ADJ_U* - Use ADJ_U* option for SBL in AERMET

CCVR_Sub - Meteorological data includes CCVR substitutions

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: OTHER

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 1291 Source(s); 17 Source Group(s); and 370 Receptor(s)

with: 14 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 1277 VOLUME source(s)
and: 0 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 18081

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor

Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)

Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 10.06 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 4.4 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: Ashley Warehouse.err

**File for Summary of Results: Ashley Warehouse.sum

EXECUTIVE SUMMARY

This report summarizes the results of the Traffic Impact Analysis (TIA) conducted for the proposed Ashley Furniture distribution center in the City of Lathrop, California. The study area is near the Roth Road and Lathrop Road interchanges on I-5, specifically located northwest of the I-5/Lathrop Road interchange.

The project proposes to develop an approximately 1.5+ million square feet building to serve as a distribution center and retail facility. The development is strategically located near the I-5/Lathrop Road interchange. The project will also construct various driveways to serve as entry points for passenger vehicles and heavy trucks. The project also proposes to construct a roundabout at the intersection of Golden Valley Parkway/Dos Reis Road.

The purpose of the Traffic Impact Analysis is to evaluate the impacts on the transportation infrastructure due to the addition of the traffic from the proposed project. The report also includes evaluations and recommendations concerning project site access and on-site circulation for vehicles, bicycles, and pedestrians, and a vehicle miles travelled analysis.

To evaluate the impacts on the transportation infrastructure due to the addition of traffic from the proposed project, 14 study intersection were evaluated during the weekday morning (a.m.) peak hour and evening (p.m.) peak hour under five study scenarios. The study intersections were evaluated under *No Project* and *Plus Project* scenarios for Baseline Conditions and Cumulative Conditions. The study intersections were also evaluated for Existing Conditions. For the purpose of this analysis, potential traffic operational effects from the proposed project are identified based on established operational thresholds for the City of Lathrop and guidance published by the California Office of Planning and Research (OPR).

Of note, this TIA constitutes a third iteration of the report based on feedback received from the City and Caltrans. The second iteration included the addition of the Cumulative and Cumulative plus Project conditions and changes to the site layout. The latter change accounted for the removal of two previous site entrances (Study Intersections #13 and #16); in order to avoid confusion and to keep consistent with the previous TIA, the intersection numbering herein has not be revised. This third iteration adds a detailed queuing analysis at all intersections associated with the I-5/Lathrop Road and I-5/Roth Road interchanges.

Project Trip Generation

Using site specific data, the proposed Ashley Furniture is expected to generate 2,798 daily trips, including 203 a.m. peak hour trips (124 inbound, 79 outbound) and 255 p.m. peak hour trips (110 inbound, 145 outbound) for passenger vehicles.

In addition, the project is expected to generate 680 daily heavy truck trips, including 95 a.m. peak hour trips (14 inbound, 81 outbound) and 45 p.m. peak hour trips (31 inbound, 14 outbound).

Existing Conditions – Intersection Level of Service

Under this scenario, all of the study intersections operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour.

Existing Conditions – Intersection Queuing

Under this scenario, simulation showed queue spillback at three of the eight intersections studied, during one or both peak hours. No queue spillbacks would affect the freeway mainline at either interchange.

Existing Conditions – Freeway Mainline Level of Service

Under this scenario, all of the study freeway segments operate at acceptable levels of service (LOS D or better) during the a.m. and p.m. peak hour.

Baseline Conditions – Intersection Level of Service

Baseline conditions include all approved growth expected to be constructed between the year 2020 and the year 2022. Under this scenario, all of the study intersections operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour, except for Lathrop Rd/I-5 NB Ramps (Intersection #2) during the p.m. peak hour, which is projected to operate at LOS E (average delay of 70.4 seconds).

Baseline Conditions – Intersection Queuing

Under this scenario, simulation showed queue spillback at five of the eight intersections studied, during one or both peak hours. No queue spillbacks would affect the freeway mainline at either interchange.

Baseline Conditions – Freeway Mainline Level of Service

Under this scenario, all of the study freeway segments are projected to operate at acceptable levels of service (LOS D or better) during the a.m. and p.m. peak hour.

Baseline plus Project Conditions – Intersection Level of Service

Under this scenario, all but three of the study intersections would continue to operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour. The following intersection already operates at unacceptable level of service without the addition of project traffic.

- Lathrop Rd/I-5 NB Ramps (Intersection #2) degrades to LOS F in the p.m. peak hour, with an increase in average delay of 19.1 seconds.
 - With the recommended improvements described in Section 5.3.1, the intersection is projected to improve to LOS C in the a.m. and p.m. peak hours, with a delay of 20.2 seconds and 34.8 seconds, respectively.

The following two intersections would degrade from acceptable to unacceptable level of service with the addition of project traffic:

- Lathrop Rd-Spartan Way/I-5 SB Ramps (Intersection #3) would degrade from LOS D to LOS E in the a.m. and p.m. peak hour, a *substantial degradation*.
 - With the recommended improvements described in Section 5.3.1, the intersection is projected to improve to LOS D in the a.m. and p.m. peak hours, with a delay of 54.5 seconds and 54.9 seconds, respectively.
- Spartan Way/Golden Valley Pkwy (Intersection #4) would degrade from LOS C to LOS E in the a.m. peak hour and LOS D to LOS F in the p.m. peak hour, a *substantial degradation*.

- With the recommended improvements described in Section 5.3.1, the intersection is projected to improve to LOS D in the a.m. and p.m. peak hours, with a delay of 48.5 seconds and 52.9 seconds, respectively.

Baseline plus Project Conditions – Intersection Queuing

Under this scenario, simulation showed queue spillback at five of the eight intersections studied, during one or both peak hours. The proposed project (with mitigations) would not generate any new queue spillbacks, and no queue spillbacks would affect the freeway mainline at either interchange.

Baseline plus Project Conditions – Freeway Mainline Level of Service

Under this scenario, all of the study freeway segments are projected to operate at acceptable levels of service (LOS D or better) during the a.m. and p.m. peak hour.

Cumulative Conditions – Intersection Level of Service

Under this scenario, seven of the study intersections are projected to operate below applicable jurisdictional standards during one or both peak hours. Three intersections at or near the Lathrop Road/I-5 interchange and four intersections at or near the Roth Road/I-5 interchange would operate at LOS F during one or both peak hours. The remaining intersections would operate within applicable standards during the a.m. and p.m. peak hours.

Cumulative Conditions – Intersection Queuing

Under this scenario, simulation showed queue spillback at six of the eight intersections studied, during one or both peak hours. No queue spillbacks would affect the freeway mainline at either interchange.

Cumulative plus Project Conditions – Intersection Level of Service

Under this scenario, seven of the study intersections are projected to continue to operate below applicable jurisdictional standards during one or both peak hours. Three intersections at or near the Lathrop Road/I-5 interchange and four intersections at or near the Roth Road/I-5 interchange would operate at LOS F during one or both peak hours. The remaining intersections would operate within applicable standards during the a.m. and p.m. peak hours. At the seven intersections operating below jurisdictional standards, added project traffic would either degrade the level of service from acceptable to unacceptable, or increase average delay by more than 5.0 seconds, constituting *substantial inconsistencies* with the City of Lathrop standards.

A fair share analysis was conducted at the Lathrop Road/I-5 interchange and the Roth Road/I-5 interchange. At the Lathrop Road/I-5 interchange, individual intersection fair share percentages range from approximately one percent to six percent (or 5.1 percent overall). At the Roth Road/I-5 interchange, individual intersection fair share percentages range from approximately one percent to nine percent (or 4.5 percent overall).

Cumulative plus Project Conditions – Intersection Queuing

Under this scenario, simulation showed queue spillback at five of the eight intersections studied, during one or both peak hours. The proposed project would generate one new queue spillback at Intersection #1, although this queue length can be fully accommodated within the taper without affecting the adjacent through lane. No queue spillbacks would affect the freeway mainline at either interchange.

VMT Impacts

The proposed project was evaluated based on guidance from the Governor's Office of Planning and Research (OPR) and San Joaquin County Transportation Analysis Guidelines. Since the project is not screened out from the maps in the County Guidelines, TJKM inserted the proposed project into the San Joaquin COG 2018 RTP model and performed a base year plus project model run.

The project's 15.43 daily VMT per employee is lower than the San Joaquin County VMT threshold of 16.2. VMT impacts for the Ashley Furniture Homestore project are found to be ***less-than-significant*** for the base year, and thus no mitigation is required for VMT impacts attributable to this project.

Site Access & On-Site Circulation

The project would be accessed by a total of four driveways. All driveways are full access driveways. Heavy trucks (larger than SU-30) will generally be restricted to only using the northern driveway on Manthey Road and the I-5/Roth Road interchange. Drive aisles for passenger vehicles vary between 26-36 feet wide, while drive aisles for heavy trucks are 60-72 feet wide. Any proposed landscaping should be maintained to provide adequate sight distance. The proposed driveway locations, design, and sight distance are all ***adequate***.

The site plan shows all proposed pedestrian facilities on the project frontage and connectivity from Manthey Road to the retail showroom entrance. The project site plan does show four crosswalks connecting the passenger vehicle parking lot to the retail showroom. The site plan shows two bike rack locations, one on the south side of the building and one on the east side. Sidewalks are planned to be provided within the passenger vehicle parking lot and along the eastern frontage of the building. Additionally, it appears that one sidewalk will front the Intersection #15 entrance (on the north side) that will connect the showroom to Manthey Road. The internal circulation on the project site is considered ***adequate***.

Truck Operations

The proposed Ashley furniture is proposing to restrict heavy trucks (larger than SU-30) from using the Lathrop Road/I-5 interchange at all times to alleviate potential congestion on those intersections. Instead, trucks will be using the Roth Road/I-5 interchange via Manthey Road to access the Ashley Furniture site via the northernmost driveway only. Only local delivery trucks would be permitted on Dos Reis Boulevard and Golden Valley Parkway. Based on the level of service analysis, additional truck traffic on the Roth Road intersections is not expected to degrade the LOS to unacceptable operations.

Parking

Based on City of Lathrop parking requirements, the project is required to provide 893 stalls. Based on the site plan, the project is proposing to provide 942 stalls, satisfying City requirements. The project will provide 1,104 trailer stalls for company operations.

Pedestrian Impacts

Pedestrian access to the project site is facilitated by new sidewalks along Dos Reis Road and Manthey Road, and paved walkways within the parking lot and crosswalks. The proposed development project does not conflict with existing and planned pedestrian facilities; therefore, the impact to pedestrian facilities is ***less than significant***.

Bicycle Impacts

As shown in **Figure 3**, there are no existing bicycle facilities on De Lima Road, Manthey Road and Dos Reis Road. If the project proposes bicycle facilities, it should show them on future site plans. The project does not conflict with existing and planned bicycle facilities; therefore, the impact to bicycle facilities is ***less than significant***.

Transit Impacts

The project site is within a 3/4 mile of two San Joaquin RTD bus stops, located on the northwest corner of Lathrop Road/Harlan Road and in front of the Save Mart. Due to the lack of development north of Spartan Way, there are sidewalk gaps from the proposed project site to the bus stops. As development in the area increases, sidewalks should be installed to close the gap in pedestrian facilities. Impacts to transit service are expected to be ***less than significant***.

1.0 INTRODUCTION

This report summarizes the results of the Traffic Impact Analysis (TIA) for the proposed Ashley Furniture distribution center located north of the Spartan Way and Golden Valley Parkway intersection in the City of Lathrop, California. The location is northwest of the I-5/Lathrop Road interchange.

1.1 PROJECT DESCRIPTION

The project proposes to develop a 1.5+ million square foot building to serve as a distribution center and retail facility. The development is strategically located near the I-5/Lathrop Road interchange, although heavy trucks will be restricted to only using the I-5/Roth Road interchange to the north. The project will include various driveways to serve as entry points for passenger vehicles and heavy trucks. The project also proposes to construct a roundabout at the intersection of Golden Valley Parkway/Dos Reis Road.

The following section discusses the TIA's purpose, study intersections, and analysis scenarios.

1.2 PROJECT PURPOSE

The purpose of the Traffic Impact Analysis is to evaluate the impacts on the transportation infrastructure due to the addition of the traffic from the proposed project. The report also includes evaluations and recommendations concerning project site access and on-site circulation for vehicles, bicycles, and pedestrians, queuing analysis at the study intersections, and parking supply.

1.3 OTHER ANALYSES

The City of Lathrop has recently updated its General Plan. The Lathrop City Council voted to adopt the General Plan Update and certify the Final Environmental Impact Report (FEIR) on September 19, 2022.

1.4 STUDY AREA

The study area is located within the city limits of Lathrop, within the Central Lathrop Specific Plan Phase 2 area. The impacts of the proposed project were evaluated for the intersections discussed below.

1.4.1 Study Intersections

TJKM evaluated traffic conditions at 14 study intersections during the a.m. and p.m. peak hours for a typical weekday. The study intersections were selected in consultation with the City of Lathrop staff. The peak periods in the City of Lathrop are between 6-9 a.m. and 3-6 p.m. The study intersections and associated traffic controls are as follows:

1. Lathrop Rd/Harlan Rd (Signal)
2. Lathrop Rd/I-5 NB Ramps* (Signal)
3. Lathrop Rd-Spartan Way/I-5 SB Ramps* (Signal)
4. Spartan Way/Golden Valley Pkwy (Signal)
5. Manthey Rd/De Lima Rd (One-Way Stop)
6. Manthey Rd/Dos Reis Rd (One-Way Stop)
7. Golden Valley Rd/Dos Reis Rd (Intersection does not currently exist)
8. Manthey Rd/Roth Rd (One-Way Stop)
9. Roth Rd/I-5 SB Ramps* (One-Way Stop)

10. Roth Rd/I-5 NB Ramps* (One-Way Stop)
11. Roth Rd/Harlan Rd (All-Way Stop)
12. Dos Reis Rd/Ashley Driveway #1 (One-Way Stop)
14. Manthey Rd/Ashley Driveway #3 (One-Way Stop)
15. Manthey Rd/Ashley Driveway #4 (One-Way Stop)

Notes:

() indicates that a intersection is owned and operated by Caltrans*

In a previous version of this TIA, there were 16 study intersections. Intersections #13 (Manthey Rd/Ashley Driveway #2) and #16 (De Lima Rd/Ashley Truck Driveway) have been removed as per the latest plan update.

Figure 1 illustrates the study intersections and the vicinity map of the proposed project. **Figure 2** shows the proposed project site plan, dated March 29, 2023.

1.4.2 Study Freeway Segments

TJKM also evaluated freeway mainline operations for the a.m. and p.m. peak hours for a typical weekday. The following freeway segments were selected in consultation with the City of Lathrop staff:

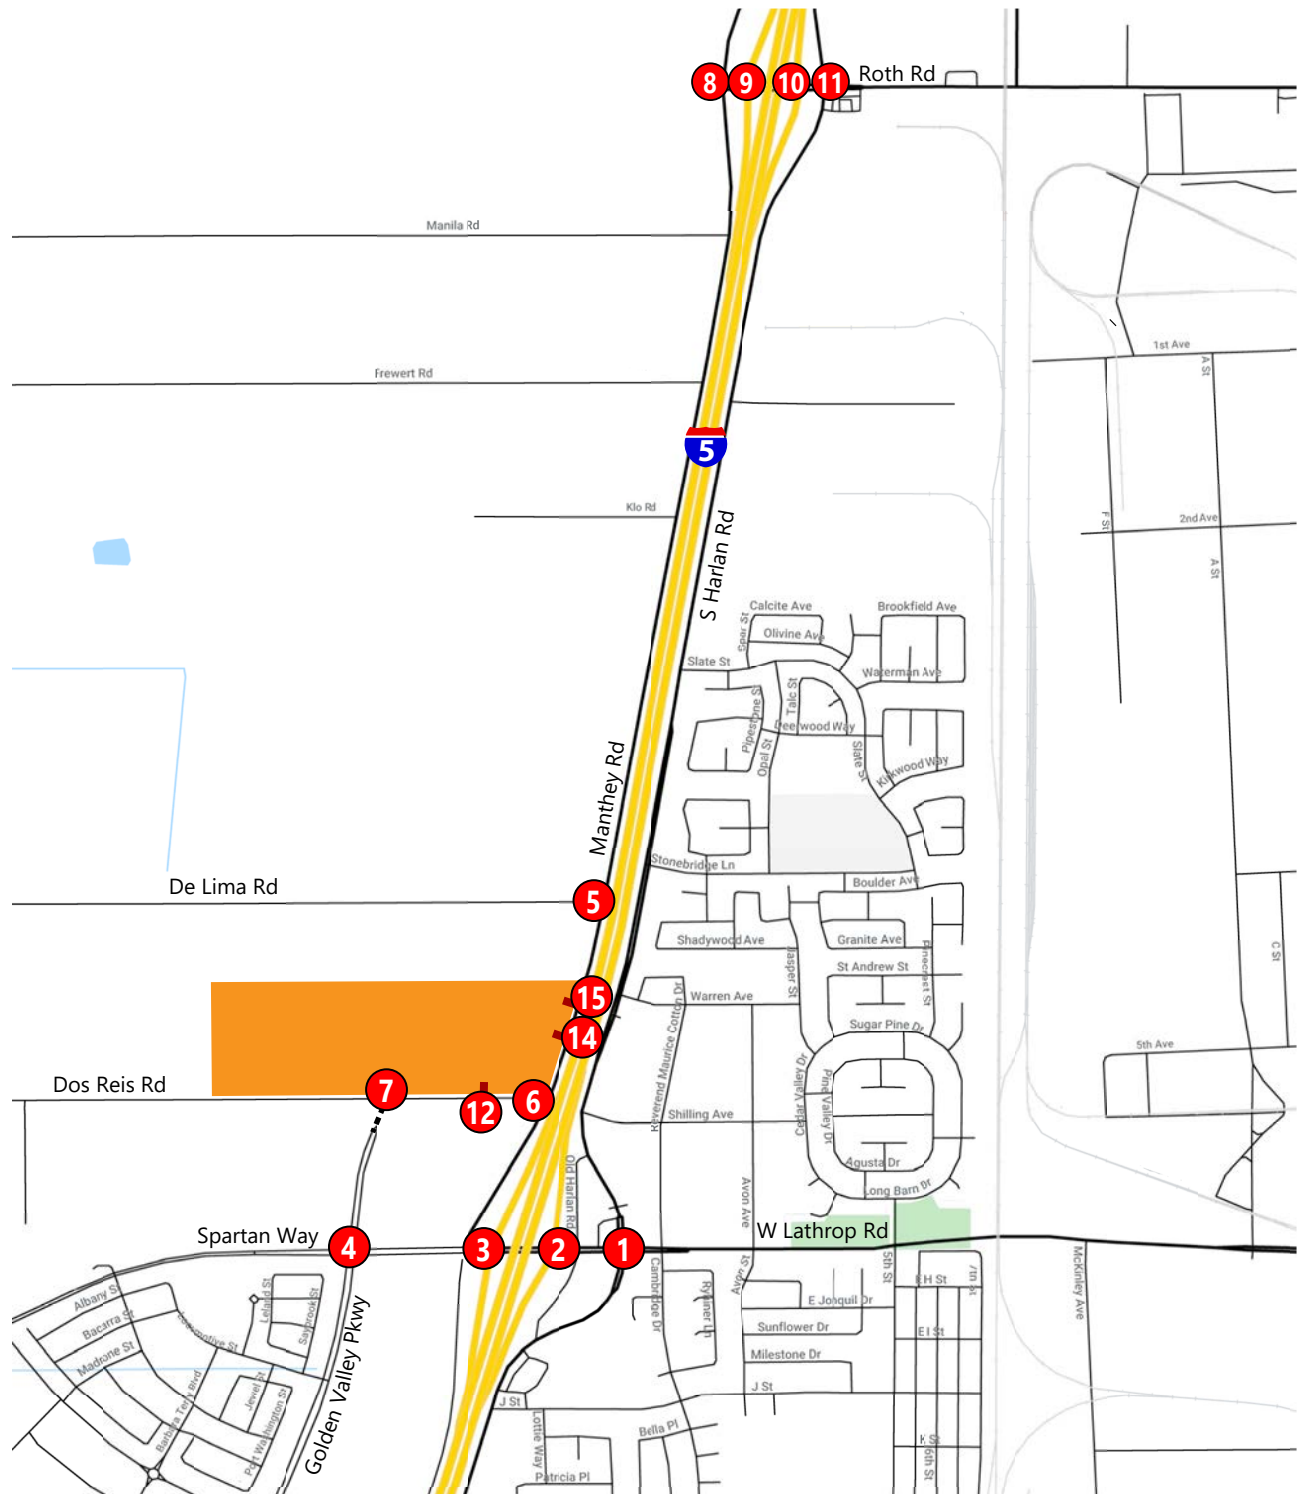

1. Interstate 5, north of Roth Road (northbound and southbound directions)
2. Interstate 5, between Roth Road and Lathrop Road (northbound and southbound directions)
3. Interstate 5, south of Lathrop Road (northbound and southbound directions)

1.5 ANALYSIS SCENARIOS

This study addresses the following five traffic scenarios:

- Existing Conditions;
- Existing plus Approved Projects (Baseline);
- Baseline plus Ashley Furniture Project;
- Cumulative Conditions; and
- Cumulative plus Ashely Furniture Project.

Figure 1: Vicinity Map

Figure 2: Site Plan

2.0 STUDY METHODOLOGY

Traffic impacts related to the proposed project were evaluated for both compliance with applicable regulatory documents and environmental significance as defined in the California Environmental Quality Act (CEQA). In accordance with the *Technical Advisory* published by the Governor's Office of Planning and Research (OPR), a qualitative VMT analysis forms the basis of the CEQA analysis for the proposed project. As of July 1, 2020, intersection level of service (LOS) can no longer be used to determine significant impacts for CEQA purposes. The City of Lathrop adopted VMT thresholds and screening criteria on September 14, 2020.

2.1 VEHICLE MILES TRAVELED

This study includes a quantitative analysis of VMT generated by the proposed project. SB 743 is intended to reduce greenhouse gas emissions and particulates, encourage infill development and a diversity of uses instead of sprawl; and promote multi-modal transportation networks.

The San Joaquin COG 2018 RTP Model was used to evaluate changes in VMT due to land use developments. For the purposes of this study, the screening guidelines and significance thresholds that are contained in the City's VMT guidelines are utilized. If a project does not meet any screening criteria, the draft guidelines specify use of the San Joaquin COG RTP Travel Demand Model to identify the appropriate project VMT.

City of Lathrop Screening Criteria

The adopted guidelines include the following screening criteria for identifying projects that can be presumed to have a less-than-significant impact:

- Small projects;
- Projects located in low VMT areas;
- Projects in proximity to a major transit stop;
- Affordable housing
- Local serving retail; and
- Transportation projects

Significance Standards

The state of California provides lead agencies latitude in adopting standards of significance for evaluating VMT impacts associated with land use projects. For this project, the San Joaquin County Transportation Analysis Guidelines were used to analyze the proposed project since the City of Lathrop VMT guidelines do not specify VMT thresholds.

2.2 LEVEL OF SERVICE ANALYSIS METHODOLOGY

Level of Service (LOS) is a qualitative measure that describes operational conditions as they relate to the traffic stream and perceptions by motorists and passengers. The LOS generally describes these conditions in terms of such factors as speed and travel time, delays, freedom to maneuver, traffic interruptions, comfort, convenience and safety. The operational LOS are given letter designations from A to F, with A representing the free-flow operating conditions and F representing the severely congested flow with high delays.

Typically, LOS C is considered as an ideal condition as it represents stable flow and efficient use of the transportation facility. Intersections generally are the capacity-controlling locations with respect to traffic operations on arterial and collector streets. The following sections provide detailed study methodology based on the type of intersections.

Signalized Intersections

The study intersections under traffic signal control were analyzed using the Highway Capacity Manual (HCM 6th Edition) methodology for signalized intersections described in Chapter 19. This methodology determines LOS based on average control delay per vehicle for the overall intersection during peak hour intersection operating conditions. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. **Table 1** summarizes the relationship between the control delay and LOS for signalized intersections. The LOS assessment under all scenarios is based on current traffic controls and optimized signal timing unless otherwise noted. The LOS methodology for Signalized intersections is described in detail in **Appendix A**.

Table 1: Level of Service Definitions for Signalized Intersections

<i>Level of Service</i>	<i>Description</i>
A	Very low control delay, up to 10 seconds per vehicle. Progression is extremely favorable, and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	Control delay greater than 10 and up to 20 seconds per vehicle. There is good progression or short cycle lengths or both. More vehicles stop causing higher levels of delay.
C	Control delay greater than 20 and up to 35 seconds per vehicle. Higher delays are caused by fair progression or longer cycle lengths or both. Individual cycle failures may begin to appear. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflow occurs. The number of vehicles stopping is significant, though many still pass through the intersection without stopping.
D	Control delay greater than 35 and up to 55 seconds per vehicle. The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volumes. Many vehicles stop, the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	Control delay greater than 55 and up to 80 seconds per vehicle. The limit of acceptable delay. High delays usually indicate poor progression, long cycle lengths, and high volumes. Individual cycle failures are frequent.
F	Control delay in excess of 80 seconds per vehicle. Unacceptable to most drivers. Oversaturation, arrival flow rates exceed the capacity of the intersection. Many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to higher delay.

Source: Highway Capacity Manual 6th Edition

Stop-Controlled Intersections

The study intersections under one/two-way stop control and all-way stop control were analyzed using the HCM 6th Edition Operations Methodology described in Chapter 20 and 21, respectively. LOS ratings for stop-sign controlled intersections are based on the average control delay expressed in seconds per vehicle. At one- or two-way stop controlled intersections, the control delay is calculated for each movement, not for the intersection as a whole. For approaches composed of a single lane, the control delay is computed as the average of all movements in that lane. The weighted average delay for the entire intersections is presented for all-way stop controlled intersections. **Table 2** summarizes the relationship between delay and LOS for stop-controlled intersections. The delay ranges for unsignalized intersections are lower than for signalized intersections, as drivers expect less delay at stop-controlled intersections.

Each of the study intersections was analyzed using *Synchro* software and HCM 6th Edition. The LOS assessment under all scenarios is based on current traffic controls unless otherwise noted. The LOS methodology for stop-controlled intersections is described in detail in **Appendix A**.

Table 2: Level of Service Definitions for Stop Controlled Intersections

<i>Level of Service</i>	<i>Description</i>
A	Very low control delay less than 10 seconds per vehicle for each movement subject to delay.
B	Low control delay greater than 10 and up to 15 seconds per vehicle for each movement subject to delay.
C	Acceptable control delay greater than 15 and up to 25 seconds per vehicle for each movement subject to delay.
D	Tolerable control delay greater than 25 and up to 35 seconds per vehicle for each movement subject to delay.
E	Limit of tolerable control delay greater than 35 and up to 50 seconds per vehicle for each movement subject to delay.
F	Unacceptable control delay in excess of 50 seconds per vehicle for each movement subject to delay.

Source: Highway Capacity Manual 6th Edition

2.3 LEVEL OF SERVICE STANDARDS

Although level of service is no longer used for identifying impacts under CEQA, level of service analysis is still used for determining consistency with adopted agency plans and standards. Where standards refer to significant environmental impacts, this analysis instead identifies these as significant inconsistencies with adopted plans.

Signalized and Stop Controlled Intersections

The City of Lathrop LOS standard is LOS D. Intersections that are expected to operate below LOS D are considered as impacted and should be considered for improvement.

While the City of Lathrop does not have specific impact criteria for intersections, a project impact would be considered substantial if:

- The project traffic added to existing conditions would result in the level of service deteriorating below the City standard. The City’s current level of service standard is LOS D.
- For intersections that already operate at unacceptable levels of service (E or F), project impacts can be considered substantial if the project trips result in an increase in delay by 5.0 seconds or more.

Caltrans Facilities

Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on all State highway facilities. Based on standard industry practice, the project is considered to trigger a substantial impact to Caltrans Facilities if the project would:

- Result in a facility that will operate at an acceptable LOS in the base (pre-project or no project) condition to deteriorate to unacceptable LOS in the “Plus Project” condition; or
- Project traffic increases the density by five percent or more at a facility that will operate at an unacceptable LOS in the base (pre-project or no project) condition.

Table 3 summarizes the HCM 6th Edition LOS criteria for basic freeway segments. *Highway Capacity Software* (HCS7) was used to calculate the level of service along freeway segments for all scenarios. For this analysis, LOS D is the acceptable threshold.

Table 3: LOS Criteria for Basic Freeway Segments

<i>Freeway Facility LOS</i>	<i>Freeway Facility Density (pc/mi/ln)</i>
A	≤ 11
B	> 11-18
C	> 18-26
D	> 26-35
E	> 35-45
F	> 45 or v/c > 1.0

Source: HCM 6th Edition

2.4 QUEUING ANALYSIS

The 95th percentile queue lengths were simulated at study intersections by running the Synchro traffic model in SimTraffic. Queuing results were based on five one-hour runs (four 15-minute intervals), with one 15-minute seeding interval. Existing queue storage consists of either turn bay lengths (not including taper) or the distance to the physical area of the next upstream intersection or freeway mainline. Queue lengths were reported for dedicated turn lanes and freeway exit ramps, at intersections that are associated with the I-5/Roth Road and I-5/Lathrop Road interchanges. As shown in **Figure 1**, this consists of Intersections #1-4 and #8-11. Queue spillbacks were identified at all intersections, defined as queue lengths that exceed the available storage length and may affect upstream traffic

3.0 EXISTING CONDITIONS

This section describes existing conditions in the immediate project site vicinity, including roadway facilities, bicycle and pedestrian facilities, and available transit service. In addition, existing traffic volumes and operations are presented for the study intersections, including the results of LOS calculations and simulation.

3.1 EXISTING SETTING AND ROADWAY SYSTEM

Access to the proposed project is provided via Lathrop Road/Spartan Way, Manthey Road, Golden Valley Parkway, Dos Reis Road and De Lima Road.

Lathrop Road/Spartan Way is primarily a four to six lane divided arterial from its western terminus at Barbara Terry Boulevard and its eastern terminus at Austin Road in Manteca. In the project vicinity, the majority of land uses will be primarily single family homes and educational facilities. The posted speed limit on Lathrop Road/Spartan Way is 35 miles per hour (mph).

Manthey Road is primarily a two lane undivided, rural road from Lathrop Road/Spartan Way to Carolyn Weston Boulevard in south Stockton. In the immediate project vicinity, the majority of land uses are open space/agricultural with a few single family home along the roadway. The posted speed limit ranges from 40-45 mph.

Golden Valley Parkway is primarily a six lane divided arterial from Spartan Way to its southern terminus at Brookhurst Boulevard. Golden Valley Parkway will primarily serve as the primary north-south arterial for residents in Central Lathrop. While much of the land surrounding Golden Valley Parkway is undeveloped, Golden Valley Parkway provides access to single family homes and Lathrop Marketplace. In the project vicinity, the posted speed limit is 45 mph.

Dos Reis Road is a two lane rural road from Manthey Road to its western terminus at the San Joaquin River. Dos Reis Road will provide access driveways to the proposed project. Most of the land uses are open space/agriculture. However, there is access to the athletic facilities of Lathrop High School. The speed limit on Dos Reis Road is 35 mph.

De Lima Road is a two lane rural road from Manthey Road to its western terminus at the San Joaquin River. De Lima Road will also provide access driveways to the proposed project. The land uses surrounded De Lima Road are mostly open space and agricultural. The speed limit along De Lima Road is 35 mph.

3.2 EXISTING PEDESTRIAN FACILITIES

Walkability is defined as the ability to travel easily and safely between various origins and destinations without having to rely on automobiles or other motorized travel. The ideal “walkable” community includes wide sidewalks, a mix of land uses such as residential, employment, and shopping opportunities, a limited number of conflict points with vehicle traffic, easy access to transit facilities and services and a network of pedestrian facilities.

Pedestrian facilities are comprised of crosswalks, sidewalks, pedestrian signals, and off-street paths, which provide safe and convenient routes for pedestrians to access the destinations such as institutions, businesses, public transportation, and recreation facilities.

Near the proposed project site, the approximate width of the sidewalk is eight feet. This sidewalk width applies to segments of Spartan Way. There are currently no sidewalks along Golden Valley Parkway (north of Spartan Way), Dos Reis Road, Manthey Road, and De Lima Road. The project proposes to develop sidewalks along Dos Reis Road and the west side of Manthey Road.

The signalized intersections provide marked crosswalks and pedestrian push buttons and signal heads.

The existing pedestrian facilities in the study area are shown in **Figure 3**.

3.3 EXISTING BICYCLE FACILITIES

The 1995 City of Lathrop Bicycle Transportation Plan outlines policies and objectives to improve the current active bicycle facilities. The various bicycle facilities are described below. Existing bicycle facilities are illustrated in **Figure 3**.

- **Class I Bikeways (Bike Paths or Shared-Use Path):** Class I Bikeways provides a completely separated right of way for bicycles and pedestrians with minimal crossflow by motorized vehicles. Bike paths provide a recreational opportunity or can serve as commute routes. In the project area, there are no Class I facilities.
- **Class II Bike Lanes:** Class II bike lanes are striped bike lanes immediately adjacent to a traffic lane. Bike lanes provide a separate pavement area from vehicular traffic and improve conditions for bicycles on roadways. In the project vicinity, Class II Bike Lanes are provided on Lathrop Road and Harlan Road.
- **Class III Bike Routes:** Class III Bike Routes provide shared use of the roadway, designated by signs or permanent markings and shared with other vehicular traffic. There are no Class III Bike Routes in the project vicinity.
- **Class IV Separated Bikeways or Cycle Tracks:** Cycle tracks are separated bikeways for the exclusive use of bicycles. Cycle tracks are usually located along the roadway, but require separation from the vehicular travel lane in the form of grade separation, planters, flexible posts, or on-street parking. There are no Class IV bikeways in the project vicinity.

3.4 EXISTING TRANSIT FACILITIES

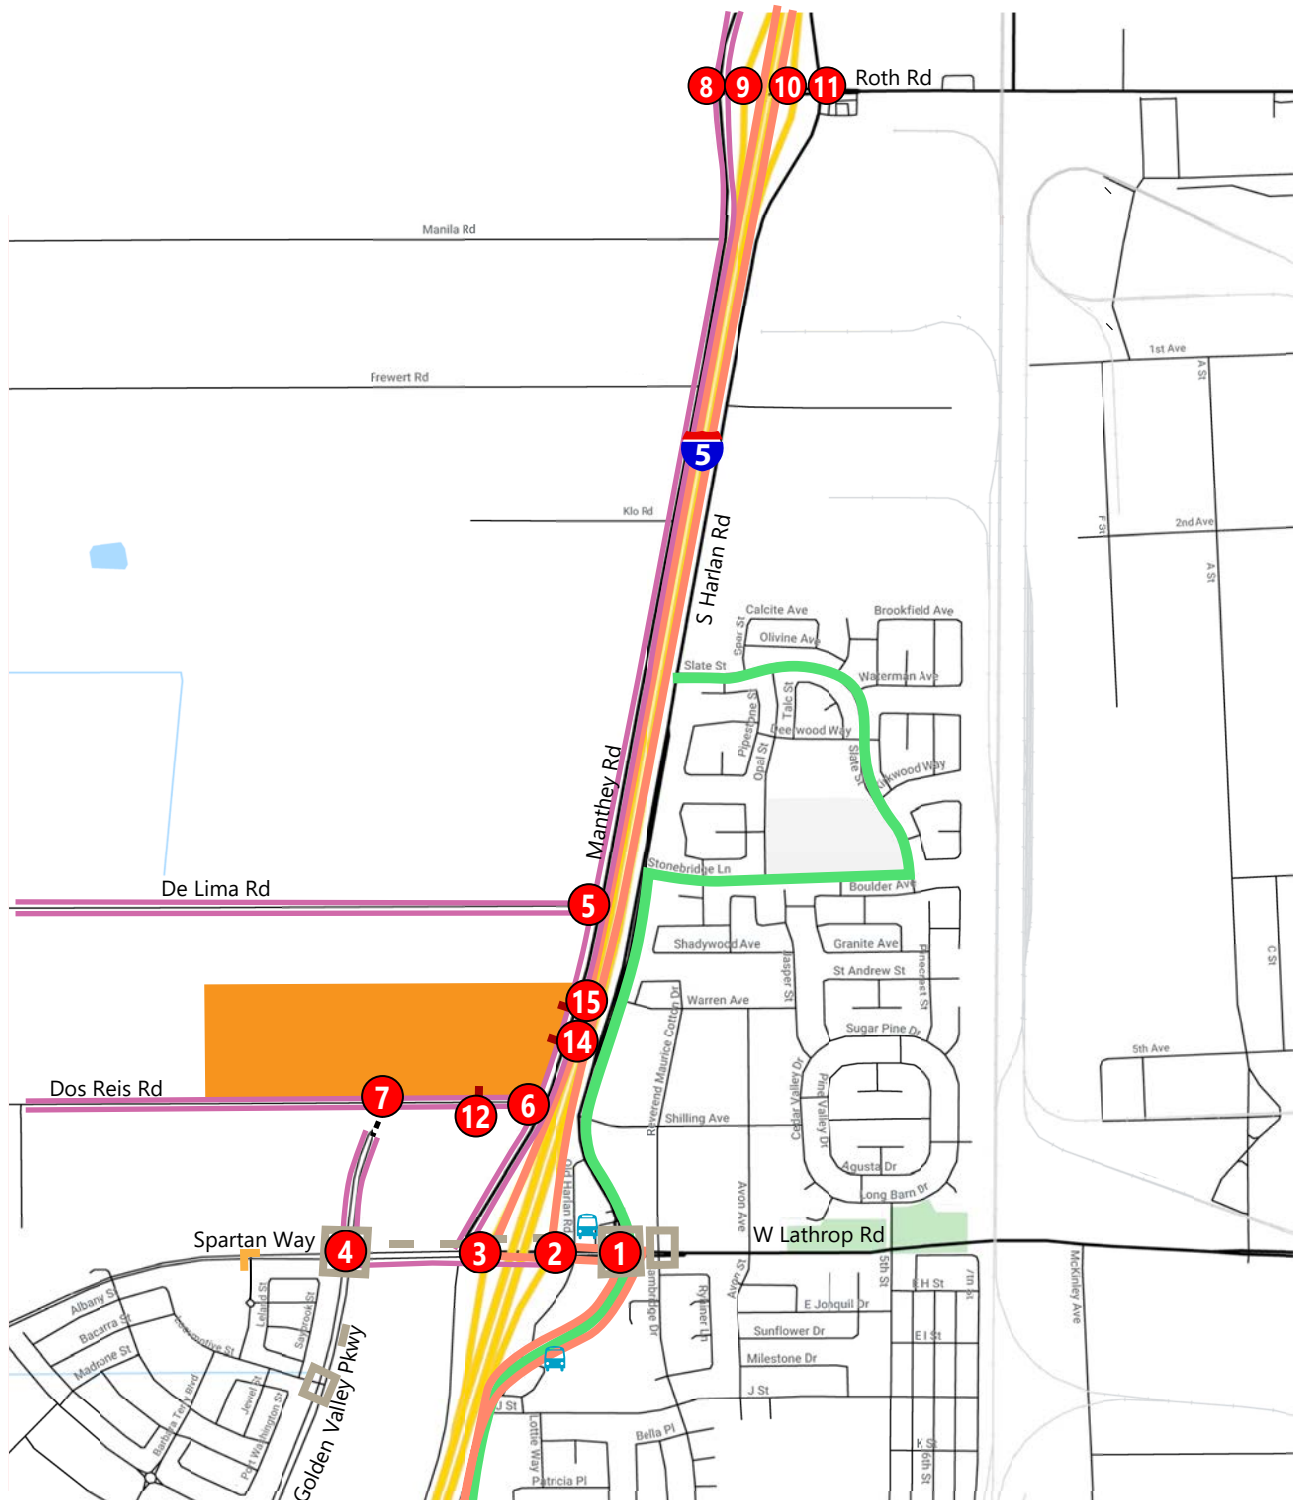

San Joaquin Regional Transit District (RTD) provides transit service throughout the San Joaquin County. **Table 4** summarizes the existing San Joaquin RTD Transit service and **Figure 3** illustrates the existing transit facilities in the study area.

Table 4: Existing San Joaquin RTD Transit Service

Route	From	To	Weekdays		Weekends	
			Operating Hours	Headway (hours)	Operating Hours	Headway (minutes)

3.5 EXISTING PEAK HOUR TRAFFIC VOLUMES AND LANE CONFIGURATIONS

The existing operations of the study intersections were evaluated for the highest one-hour volumes during weekday morning and evening peak periods. Due to COVID-19 conditions, the ability to collect accurate new traffic counts is limited. The City of Lathrop approved the use of the projected 2020 intersection turning movement counts from the *2018 Traffic Monitoring Program for The City of Lathrop* for the existing conditions scenario. 2020 freeway mainline volumes were obtained from Caltrans Performance Measurement System (PeMS).

Figure 4 illustrates the existing lane geometry, traffic controls, and volumes at the study intersections. **Figure 5** illustrates the existing a.m. and p.m. peak hour freeway mainline volumes.

3.6 INTERSECTION LEVEL OF SERVICE ANALYSIS – EXISTING CONDITIONS

Existing intersection lane configurations and turning movement volumes are used to calculate the level of service for the study intersections during each peak hour. Existing signal timings at the signalized study intersections were used. The results of the level of service analysis using the Synchro software program for Existing Conditions are summarized in **Table 5**. LOS worksheets are provided in **Appendix B**.

Under this scenario, all of the study intersections operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour.

Table 5: Intersection Level of Service Analysis – Existing Conditions

#	Intersection	Control	Peak Hour ¹	Existing Conditions Delay ²	LOS ³
1	Lathrop Rd/Harlan Rd	Signal	AM	30.6	C
			PM	40.0	D
2	Lathrop Rd/I-5 NB Ramps	Signal	AM	23.9	C
			PM	26.5	C
3	Lathrop Rd-Spartan Way/I-5 SB Ramps	Signal	AM	29.7	C
			PM	17.3	B
4	Spartan Way/Golden Valley Parkway	Signal	AM	15.5	B
			PM	13.8	B

		Stop	PM	N/A	N/A
15	Manthey Rd/Ashley Dwy #4	One-Way	AM	N/A	N/A
		Stop	PM	N/A	N/A

Notes:

1. AM – morning peak hour, PM – evening peak hour

2. Delay – Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop controlled intersections. Total control delay for the worst movement is presented for side-street stop – controlled intersections.

3. LOS – Level of Service. **Bold** indicates unacceptable LOS and Delay.

3.7 INTERSECTION QUEUING – EXISTING CONDITIONS

Under this scenario, simulation showed queue spillback at three of the eight intersections studied, during one or both peak hours. Queue lengths exceeded the available storage at Lathrop Road/Harlan Road (Intersection #1), Lathrop Road-Spartan Way/I-5 Southbound Ramps (Intersection #3), and Roth Road/I-5 Southbound Ramps (Intersection #9). At Intersections #1 and #9, this involved turning queues spilling back from the turn pockets into the turn lane taper and potentially the adjacent through lane. At Intersection #3 the queue would extend into the upstream intersection. No queue spillbacks would affect the freeway mainline at either interchange.

Table 6: Intersection Queuing – Existing Conditions

#	Intersection	Control	Direction	Movement	Existing Storage (ft.)	Peak Hour ¹	Queue Length (ft.)

Notes:

* Indicates that available storage extends to upstream intersection or freeway mainline

- Indicates no queue reported by SimTraffic. Zero volume assigned.

Bold indicates that required storage exceeds existing storage.

3.8 FREEWAY MAINLINE LEVEL OF SERVICE – EXISTING CONDITIONS

The results of the freeway mainline segments level of service along Interstate 5 is summarized in **Table 6**. HCS7 freeway segment reports are attached in **Appendix C**. Under Existing Conditions, all freeway mainline segments operate at LOS D or better during both peak hours.

Table 7: Freeway Segment Level of Service Analysis – Existing Conditions

#	Segment Name	AM Peak Hour		PM Peak Hour	
		Density (pc/mi/ln)	LOS	Density (pc/mi/ln)	LOS
I-5 Northbound					
1	North of Roth Rd	24.4	C	26.6	D

2	Between Roth Rd and Lathrop Rd	24.2	C	23.8	C
3	South of Lathrop Rd	25.4	C	24.9	C

4.0 BASELINE CONDITIONS

This section presents the results of the level of service calculations under Baseline Conditions without the project. Level of service analysis at the study intersections were conducted for Baseline Conditions to establish a baseline to evaluate the impacts due to the addition of traffic from the proposed project. Baseline volumes for the study intersections were referenced from the *2018 Traffic Monitoring Program for The City of Lathrop*. The expected growth in the City of Lathrop between the year 2020 and the year 2022 includes:

- 1,210 new single family residences
- 2,790,350 additional square feet of warehouse/distribution facilities
- 196 hotel rooms
- 326,195 additional square feet of commercial uses

Figure 6 illustrates the Baseline Conditions intersection volumes.

4.1 INTERSECTION LEVEL OF SERVICE ANALYSIS – BASELINE CONDITIONS

The intersection LOS analysis results for Baseline Conditions are summarized in **Table 7**. Detailed calculation sheets for Baseline Conditions are contained in **Appendix D**.

All of the study intersections are projected to operate within the applicable jurisdictional standards during the a.m. and p.m. peak hour except for Lathrop Rd/I-5 NB Ramps during the p.m. peak hour, which is projected to operate at LOS E.

Table 8: Intersection Level of Service – Baseline Conditions

#	Intersection	Control	Peak Hour ¹	Baseline Conditions Delay ²	LOS ³
1	Lathrop Rd/Harlan Rd	Signal	AM	32.5	C
			PM	53.5	D

		Stop	PM	N/A	N/A

Notes:

1. AM – morning peak hour, PM – evening peak hour
2. Delay – Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop controlled intersections. Total control delay for the worst movement is presented for side-street stop – controlled intersections.
3. LOS – Level of Service. **Bold** indicates unacceptable LOS and Delay.

4.2 INTERSECTION QUEUING – BASELINE CONDITIONS

Under this scenario, simulation showed queue spillback at five of the eight intersections studied, during one or both peak hours. Queue lengths exceeded the available storage at Lathrop Road/Harlan Road (Intersection #1), Lathrop Road-Spartan Way/I-5 Southbound Ramps (Intersection #3), Spartan Way/Golden Valley Parkway (Intersection #4), Roth Road/I-5 Southbound Ramps (Intersection #9), and Roth Road/Harlan Road (Intersection #11). At Intersections #1, #4, and #9, this involved turning queues spilling back from the turn pockets into the turn lane taper and potentially adjacent through lane. At Intersections #3 and #11, the queues would extend into the upstream intersection. No queue spillbacks would affect the freeway mainline at either interchange.

Table 9: Intersection Queuing – Baseline Conditions

#	Intersection	Control	Direction	Movement	Existing Storage (ft.)	Peak Hour ¹	Queue Length (ft.)

Notes:

* Indicates that available storage extends to upstream intersection or freeway mainline

- Indicates no queue reported by SimTraffic. Zero volume assigned.

Bold indicates that required storage exceeds existing storage.

4.3 FREEWAY MAINLINE LEVEL OF SERVICE – BASELINE CONDITIONS

To project the freeway volumes for Baseline Conditions, TJKM used the San Joaquin Council of Governments (SJCOG) Travel Demand Model to develop a.m. and p.m. peak hour growth rates along Interstate 5 in the project vicinity. The growth rates were applied to Existing mainline volumes to project Baseline Conditions. **Figure 7** illustrates the freeway mainline volumes for Baseline Conditions.

The results of the freeway mainline segments levels of service along Interstate 5 are summarized in **Table 8**. HCS7 freeway segment reports are attached in **Appendix E**. Under Baseline Conditions, all freeway mainline segments operate at LOS D or better during both peak hours.

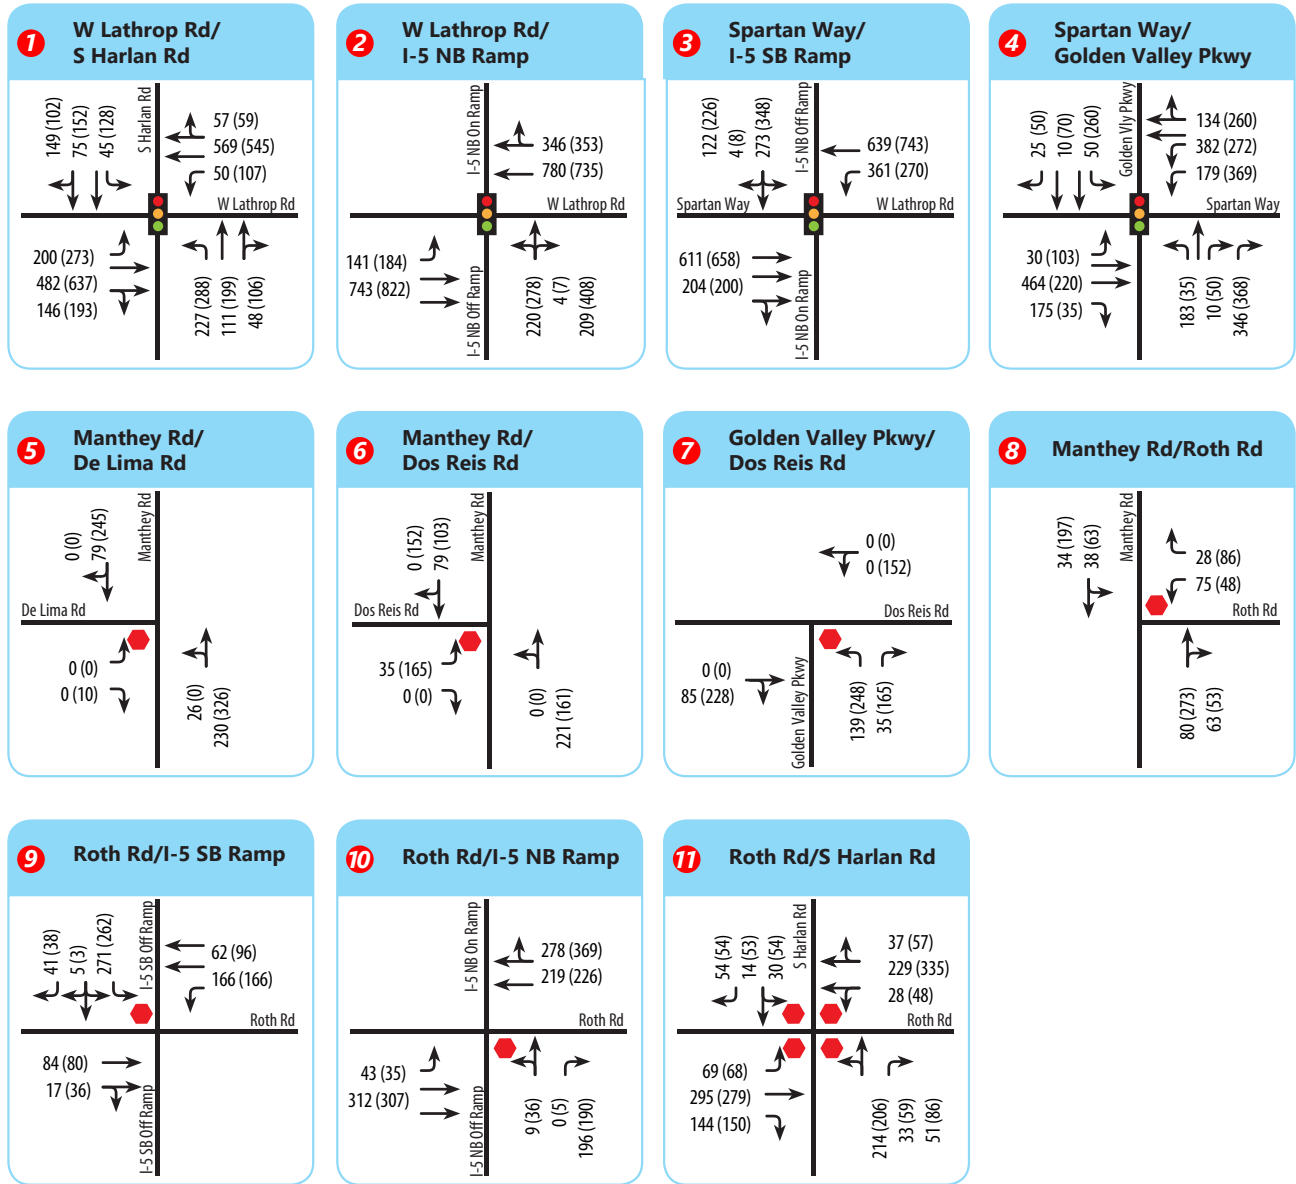

Table 10: Freeway Segment Level of Service Analysis – Baseline Conditions

5.0 BASELINE PLUS PROJECT CONDITIONS

This section describes the operational impacts of the proposed project on the transportation system in the immediate project site vicinity. Baseline plus Project Conditions consist of baseline traffic volumes and roadway facilities, plus new traffic generated by the proposed project.

The amount of traffic added to the roadway system by the proposed development is estimated using a three-step process.

- Trip Generation – Estimates the amount of traffic added to the roadway network,
- Trip Distribution – Estimates the direction of travel to and from the project site,
- Trip Assignment – The new trips are assigned to specific street segments and intersection turning movements.

5.1 PROJECT TRIP GENERATION

To determine the amount of peak hour and daily trips generated by the Ashley Furniture Homestore, 24 hour driveway counts were conducted at an existing Ashley Furniture facility located at 18290 S. Harlan Road in Lathrop. The two driveways are exclusively used by customers, employees, and delivery trucks of the Ashley furniture facility. **Appendix F** contains the traffic data collection sheets. **Tables 9** and **10** summarize the trips by passenger vehicles/heavy trucks and the inbound/outbound splits for the existing Ashley facility, respectively.

Table 11: Driveway Counts Summary

<i>Time Period</i>	<i>Cars</i>			<i>Heavy Trucks</i>		
	<i>In</i>	<i>Out</i>	<i>Total</i>	<i>In</i>	<i>Out</i>	<i>Total</i>
AM Peak Hour	43	28	71	5	28	33
PM Peak Hour	38	51	89	11	5	16
Daily	488	491	979	122	116	238

Table 12: Driveway Inbound/Outbound Splits

<i>Time Period</i>	<i>Cars</i>		<i>Trucks</i>	
	<i>In</i>	<i>Out</i>	<i>In</i>	<i>Out</i>
AM Peak Hour	61%	39%	15%	85%
PM Peak Hour	43%	57%	69%	31%
Daily	50%	50%	51%	49%

The approximate square footage of the existing Ashley facility is 525,000 square foot. With this information and data collection, approximate trip rates were developed for passenger vehicles and heavy trucks. **Table 11** summarizes the daily, a.m. peak hour, and p.m. peak hour trip rates for passenger vehicles. **Table 12** summarizes the daily a.m. peak hour, and p.m. peak hour trip rates for heavy trucks.

Table 13: Passenger Vehicle Trip Rates

<i>Time Period</i>	<i>Rate (Trips/1000 s.f.)</i>
Daily Passenger Vehicles	1.865
AM Peak Hour Passenger Vehicles	0.135
PM Peak Hour Passenger Vehicles	0.170

Table 14: Heavy Vehicle Trip Rates

<i>Time Period</i>	<i>Rate (Trips/1000 s.f.)</i>
Daily Heavy Trucks	0.453
AM Peak Hour Heavy Trucks	0.063
PM Peak Hour Heavy Trucks	0.030

The proposed Ashley Furniture is projected to generate 2,798 daily passenger vehicles, 203 a.m. peak hour passenger vehicles, and 255 p.m. peak hour passenger vehicles. The proposed Ashley Furniture is projected to generate 680 daily heavy trucks, 95 a.m. peak hour trucks, and 45 p.m. peak hour trucks. It should be noted that the current plan is to restrict heavy truck operations by requiring trucks to use the Roth Road interchange at all times. **Table 13** and **Table 14** summarizes the trip generation for passenger vehicles and heavy trucks, respectively.

Table 15: Project Trip Generation for Passenger Vehicles

Net Trips			680			14	81	95			31	14	45

5.2 PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

Trip distribution is a process of developing study assumptions that estimates the direction vehicular trips will arrive and depart the study site. Trip assignment estimates specific streets and turning movements at study intersections for project-related or site traffic. Trip distribution assumptions for the proposed project are developed based existing travel patterns and knowledge of the study area. **Figure 8** and **Figure 9** illustrate the trip distribution and trip assignment for passenger vehicles, respectively. **Figure 10** and **Figure 11** illustrate the trip distribution and trip assignment for heavy trucks, respectively.

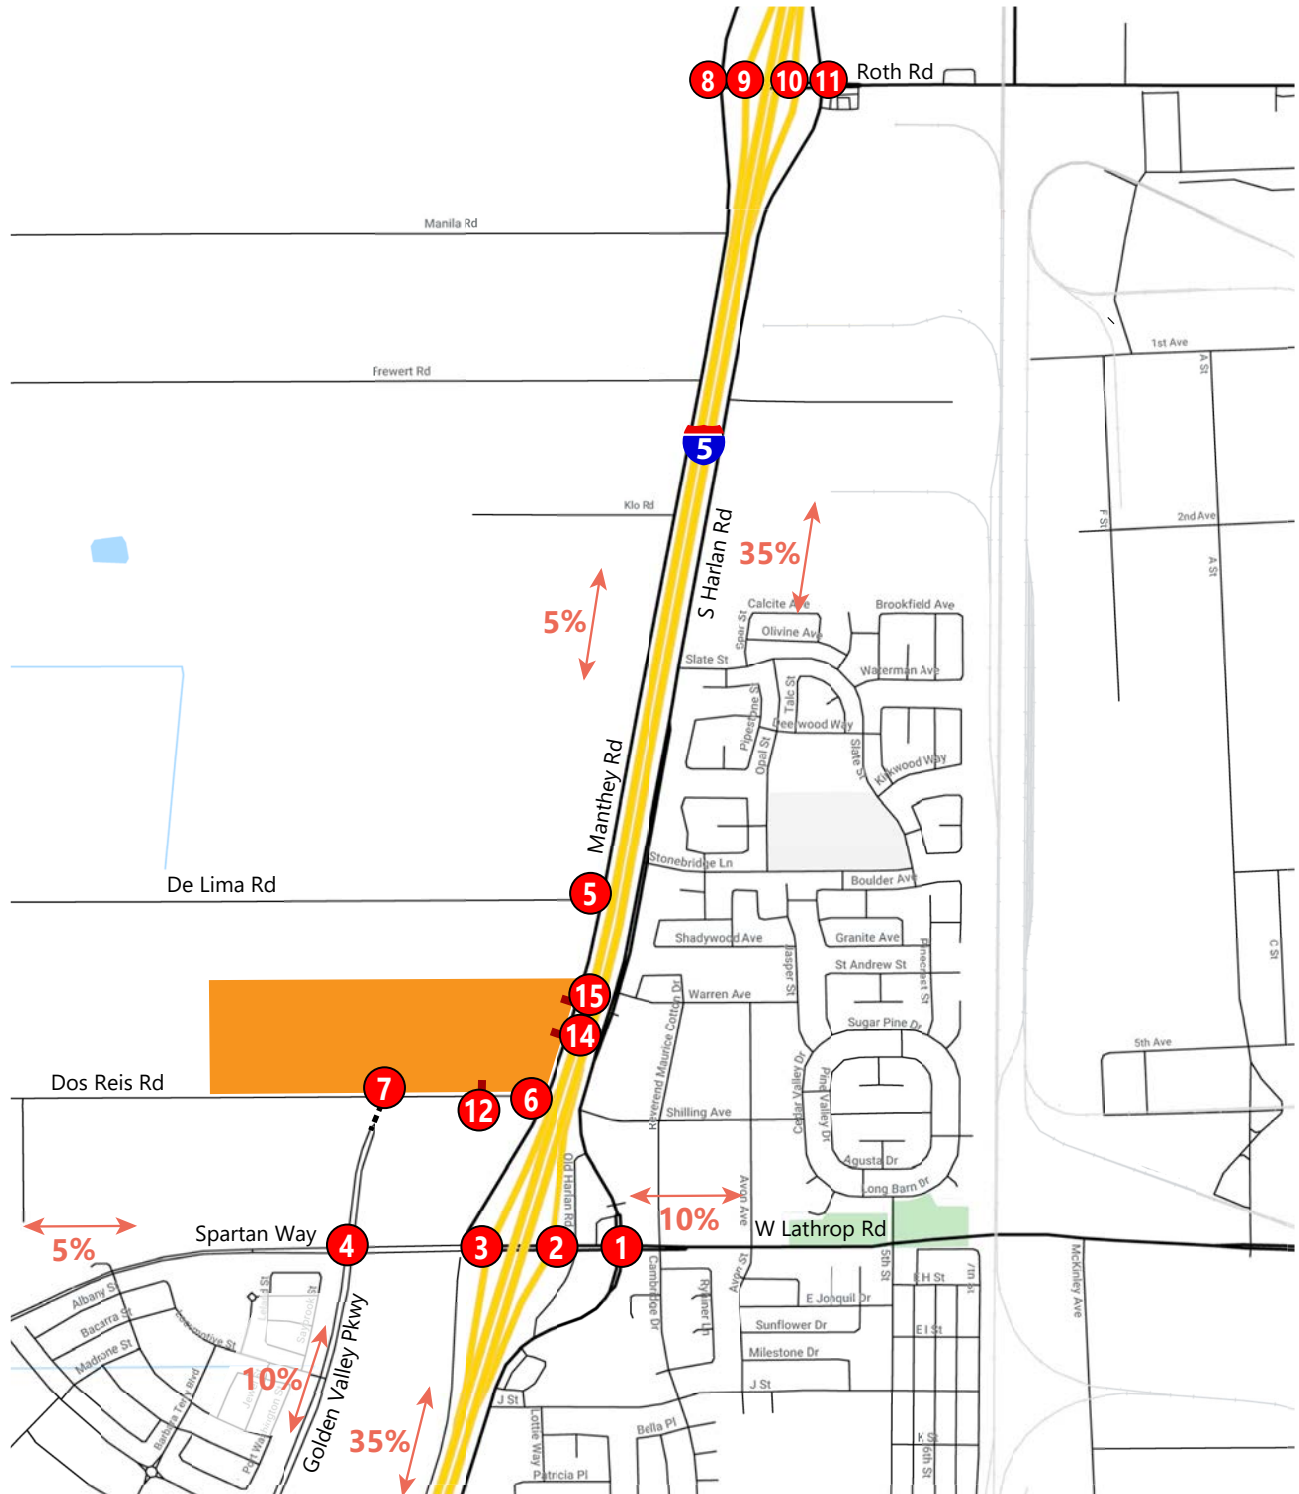

Trip distribution for passenger vehicles is as follows:

- 35 percent to/from Interstate 5, south of Lathrop Road;
- 35 percent to/from Interstate 5 north of Lathrop Road;
- 10 percent to/from Lathrop Road, east of Interstate 5;
- 10 percent to/from Golden Valley Parkway, south of Spartan Way;
- 5 percent to/from Spartan Way, west of Golden Valley Parkway; and
- 5 percent to/from Manthey Road, north of project site.

Trip distribution for heavy trucks is as follows:

- 45 percent to/from Interstate 5, north of Roth Road;
- 45 percent to/from Interstate 5, south of Roth Road; and
- 10 percent to/from Roth Road, east of Interstate 5.

5.3 INTERSECTION LEVEL OF SERVICE ANALYSIS – BASELINE PLUS PROJECT CONDITIONS

The intersection level of service analysis results for Baseline plus Project Conditions are summarized in **Table 15**. The results for Baseline Conditions are included for comparison purposes. Detailed calculation sheets for Baseline Plus Project Conditions are contained in **Appendix G. Figure 12** displays projected peak hour turning movement volumes at all of the study intersections for Baseline plus Project Conditions.

Under this scenario, all but three of the study intersections would continue to operate at acceptable service levels (LOS D or better) during the a.m. and p.m. peak hour. The following intersection already operates at unacceptable level of service without the addition of project traffic.

- Lathrop Rd/I-5 NB Ramps (Intersection #2) degrades to LOS F in the p.m. peak hour, with an increase in average delay of 19.1 seconds.

The following two intersections would degrade from acceptable to unacceptable level of service with the addition of project traffic:

- Lathrop Rd-Spartan Way/I-5 SB Ramps (Intersection #3) would degrade from LOS D to LOS E in the a.m. and p.m. peak hour, a *substantial degradation*.
- Spartan Way/Golden Valley Pkwy (Intersection #4) would degrade from LOS C to LOS E in the a.m. peak hour and LOS D to LOS F in the p.m. peak hour, a *substantial degradation*.

At the three intersections listed above, added project traffic would either degrade the level of service from acceptable to unacceptable, or increase average delay by more than 5.0 seconds, constituting *inconsistencies* with the City of Lathrop standards.

Table 17: Intersection Level of Service Analysis – Baseline plus Project Conditions

#	Study Intersections	Control	Peak Hour ¹	Baseline Conditions		Baseline Plus Project Conditions	
				Delay ²	LOS ³	Delay ²	LOS ³

			PM	N/A	N/A	17.4	C

Notes:

1. AM – morning peak hour, PM – evening peak hour
2. Delay – Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop controlled intersections. Total control delay for the worst movement is presented for side-street stop – controlled intersections.
3. LOS – Level of Service. **Bold** indicates unacceptable Level of Service.

5.3.1 Baseline plus Project Recommended Improvements

The City of Lathrop is in the process of planning the improvement of the Lathrop Road/I-5 Interchange by widening Lathrop Road to three lanes in each direction, constructing new southbound loop on-ramps, and widening off-ramps with new signalized intersections. This major improvement project is not funded or scheduled at this time, although it is included in the current Capital Improvement Plan (CIP). The Ashley project is expected to fund its fair share of the project by payment of local and regional development fees, as discussed further in Section 7.1.1, consistent with the City of Lathrop General Plan and the City's efforts to achieve an acceptable level of service at the Lathrop Road/I-5 Interchange.

While the Lathrop Road Interchange project can be considered a cumulative improvement, the City of Lathrop is considering widening the northbound off-ramp to provide an additional turn lane as an interim measure as of the 2022 Transportation Monitoring Plan (TMP). For the Lathrop Road/I-5 NB Ramps, the addition of a separate right-turn lane for the off-ramp and signal timing optimization will improve the intersection operation to LOS C in the a.m. and p.m. peak hours, which is consistent with the City of Lathrop General Plan. Based on 95th percentile queue lengths, the new lane should provide at least 400 ft. of storage.

In order to assess the feasibility of widening the northbound off-ramp as proposed, TJKM reviewed the future configuration of the Lathrop Road interchange as shown in the current CIP. Based on the CIP, it appears that although the southbound ramps would be repositioned and reconfigured, the northbound off-ramp would only be widened. It may be possible to construct an interim widening of this ramp, as proposed here and in the TMP, while remaining consistent with the ultimate configuration.

For the Lathrop Road/I-5 SB Ramps, signal timing adjustments will improve the intersection operation to LOS D in the a.m. and p.m. peak hour, which is consistent with the City of Lathrop General Plan and the City's efforts to achieve an acceptable level of service at the Lathrop Road/I-5 Interchange. Widening is not necessary for Baseline plus Project Conditions at the southbound off-ramp, although it is recommended in the 2022 TMP.

For Spartan Way/Golden Valley Parkway, the following lane geometry is recommended:

- NB approach: one left-turn lane, one through lane, two right-turn lanes.
- SB approach: two left-turn lanes, two through lanes, one right-turn lane.
- EB approach: one left-turn lane, two through lanes, one right-turn lane.
- WB approach: two left-turn lanes, two through lanes, one right-turn lane.

These changes can be accomplished through restriping existing pavement. Also, optimizing the signal timings at the intersection is projected to improve operations to LOS D in the a.m. and p.m. peak hours, with a delay of 48.5 seconds and 52.9 seconds, respectively, which is consistent with the City of Lathrop General Plan. The intersection LOS sheets with recommendations are included in **Appendix G**.

5.4 INTERSECTION QUEUING – BASELINE PLUS PROJECT CONDITIONS

Under this scenario, simulation showed queue spillback at five of the eight intersections studied, during one or both peak hours. Queue lengths exceeded the available storage at Lathrop Road/Harlan Road (Intersection #1), Lathrop Road-Spartan Way/I-5 Southbound Ramps (Intersection #3), Spartan Way/Golden Valley Parkway (Intersection #4), Roth Road/I-5 Southbound Ramps (Intersection #9), and Roth Road/Harlan Road (Intersection #11). At Intersections #1, #4, and #9, this involved turning queues spilling back from the turn pockets into the turn lane taper and potentially adjacent through lane. At Intersections #3 and 11, the queues would extend into the upstream intersection. The proposed project (with mitigations) would not generate any new queue spillbacks, although it does add to some spillbacks present under Baseline Conditions. No queue spillbacks would affect the freeway mainline at either interchange.

Table 18: Intersection Queuing – Baseline plus Project Conditions with Mitigations

#	Intersection	Control	Direction	Movement	Existing Storage (ft.)	Peak Hour ¹	Baseline Queue Length (ft.)	Baseline plus Project Queue Length (ft.)

5.5 FREEWAY MAINLINE LEVEL OF SERVICE – BASELINE PLUS PROJECT CONDITIONS

The results of the freeway mainline segments level of service along Interstate 5 is summarized in **Table 16**. HCS7 freeway segment reports are attached in **Appendix H. Figure 13** illustrates the Baseline plus Project freeway mainline volumes. Under Baseline plus Project Conditions, all freeway mainline segments operate at LOS D or better during both peak hours.

6.0 CUMULATIVE CONDITIONS

This section presents the results of the level of service calculations under Cumulative Conditions without the project. Cumulative plus Project Conditions traffic volumes were modeled by Fehr & Peers as part of the *Roth Road Improvement Study*, currently in progress, in coordination with City of Lathrop staff. The volumes from the *Roth Road Improvement Study* accounted for future conditions with the construction of the Ashley project. As such, Project trips were deducted to estimate Cumulative (no project) Conditions. Cumulative Conditions represent estimated 2040 traffic volumes. Although improvements are planned on Roth Road and Lathrop Road, for the purposes of this analysis, lane geometry, traffic controls, and other parameters are identical to Baseline Conditions. A peak hour factor of 1.0 is assumed for all intersections.

6.1 INTERSECTION LEVEL OF SERVICE ANALYSIS – CUMULATIVE CONDITIONS

The intersection LOS analysis results for Cumulative Conditions are summarized in **Table 17**. Detailed calculation sheets for Baseline Conditions are contained in **Appendix I**. **Figure 14** displays projected peak hour turning movement volumes at all of the study intersections for Cumulative Conditions.

Under this scenario, seven of the study intersections are projected to operate below applicable jurisdictional standards during one or both peak hours. Three intersections at or near the Lathrop Road/I-5 interchange and four intersections at or near the Roth Road/I-5 interchange would operate at LOS F during one or both peak hours. The remaining intersections would operate within applicable standards during the a.m. and p.m. peak hours.

Table 20: Intersection Level of Service – Baseline Conditions

#	Intersection	Control	Peak Hour ¹	Cumulative Conditions Delay ²	LOS ³
1	Lathrop Rd/Harlan Rd	Signal	AM PM	45.6 48.1	D D

Notes:

1. AM – morning peak hour, PM – evening peak hour

2. Delay – Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop controlled intersections. Total control delay for the worst movement is presented for side-street stop – controlled intersections.

3. LOS – Level of Service. **Bold** indicates unacceptable LOS and Delay.

6.2 INTERSECTION QUEUING – CUMULATIVE CONDITIONS

Under this scenario, simulation showed queue spillback at six of the eight intersections studied, during one or both peak hours. Queue lengths exceeded the available storage at Lathrop Road/Harlan Road (Intersection #1), Lathrop Road/I-5 Northbound Ramps (Intersection #2), Lathrop Road-Spartan Way/I-5 Southbound Ramps (Intersection #3), Spartan Way/Golden Valley Parkway (Intersection #4), Roth Road/I-5 Southbound Ramps (Intersection #9), and Roth Road/Harlan Road (Intersection #11). At Intersections #1, #4, and #9, this involved turning queues spilling back from the turn pockets into the turn lane taper and potentially adjacent through lane. At Intersections #2, #3 and #11, the queues would extend into the upstream intersection. No queue spillbacks would affect the freeway mainline at either interchange.

It should be noted that both interchanges are planned for reconstruction before 2040, as discussed above, and as such these projected queuing conditions are unlikely to occur.

Table 21: Intersection Queuing – Existing Conditions

7.0 CUMULATIVE PLUS PROJECT CONDITIONS

This section presents the results of the level of service calculations under Cumulative Conditions. Cumulative plus Project Conditions traffic volumes were modeled by Fehr & Peers as part of the *Roth Road Improvement Study*, currently in progress, in coordination with City of Lathrop staff. Although improvements are planned on Roth Road and Lathrop Road, for the purposes of this analysis, lane geometry, traffic controls, and other parameters are identical to Baseline Conditions. A peak hour factor of 1.0 is assumed for all intersections.

7.1 INTERSECTION LEVEL OF SERVICE ANALYSIS – CUMULATIVE PLUS PROJECT CONDITIONS

The intersection level of service analysis results for Cumulative plus Project Conditions are summarized in **Table 18**. The results for Cumulative Conditions are included for comparison purposes. Detailed calculation sheets for Cumulative Plus Project Conditions are contained in **Appendix J. Figure 15** displays projected peak hour turning movement volumes at all of the study intersections for Cumulative plus Project Conditions.

Under this scenario, seven of the study intersections are projected to continue to operate below applicable jurisdictional standards during one or both peak hours. Three intersections at or near the Lathrop Road/I-5 interchange and four intersections at or near the Roth Road/I-5 interchange would operate at LOS F during one or both peak hours. The remaining intersections would operate within applicable standards during the a.m. and p.m. peak hours.

At the seven intersections operating below jurisdictional standards, added project traffic would either degrade the level of service from acceptable to unacceptable, or increase average delay by more than 5.0 seconds, constituting *inconsistencies* with the City of Lathrop standards.

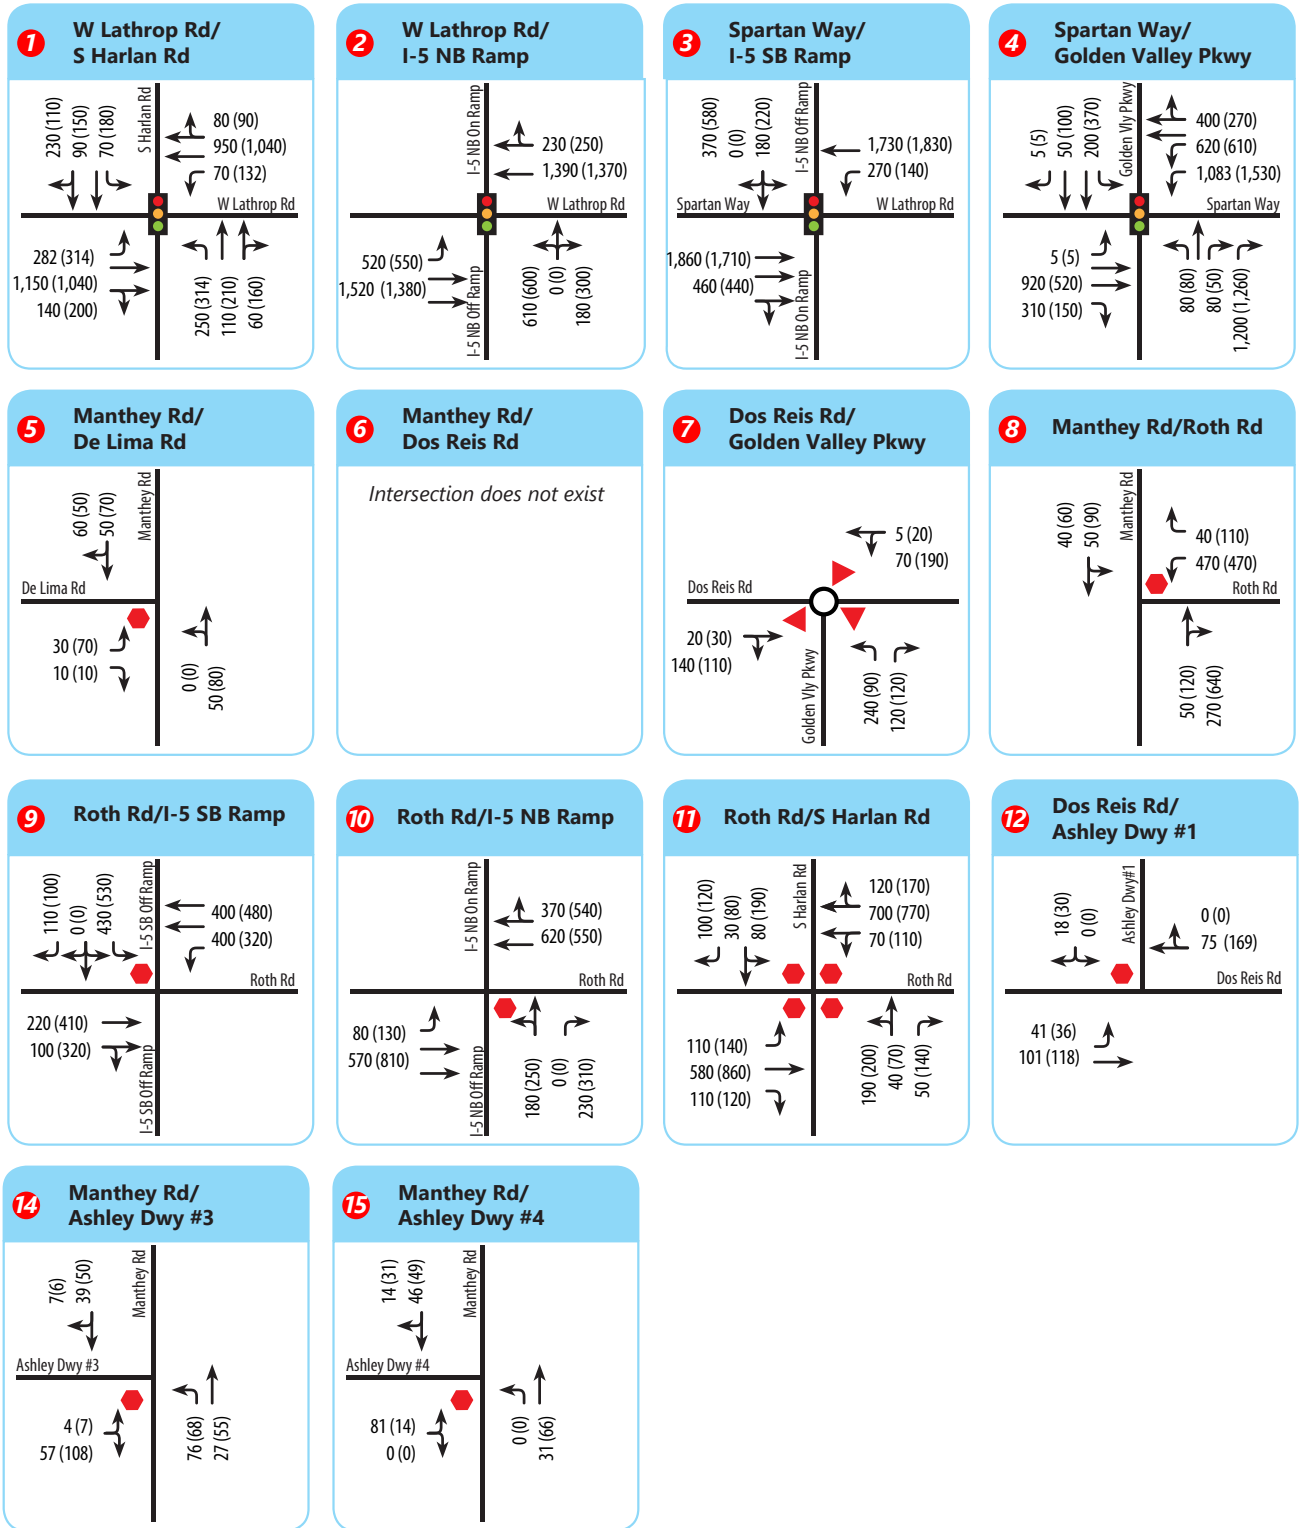

Table 22: Intersection Level of Service Analysis – Cumulative plus Project Conditions

7.1.1 Fair Share Analysis

The City of Lathrop is in the process of planning the improvement of both the Lathrop Road/I-5 Interchange and the Roth Road/I-5 Interchange. These interchange projects consist of Intersections #1-4 and 8-11, respectively.

At the direction of City of Lathrop staff, a fair share analysis was conducted for impacted intersections and intersections that are part of both interchange projects. “Fair Share” is defined as the percent contribution of project traffic to the growth from Existing Conditions to Cumulative plus Project Conditions. **Table 19** shows the fair share for a.m. plus p.m. peak hour volumes at these eight intersections. As it is expected that interchange improvements will be identified and funded prior to 2040, no interim improvement measures are recommended at those locations for this scenario.

At the Lathrop Road/I-5 interchange, individual intersection fair share percentages range from one percent to six percent (5.1 percent overall). At the Roth Road/I-5 interchange, individual intersection fair share percentages range from one percent to nine percent (4.5 percent overall).

The Ashley project is expected to fund its fair share of the interchange project costs by payment of local and regional development fees, consistent with the City of Lathrop General Plan policies and the City’s efforts to achieve an acceptable level of service.

Table 23: Fair Share Analysis

#	Study Intersections	Existing A	Project Trips B	Cumulative plus Project C	Cumulative Growth D = C-A	Fair Share B/D
1	Lathrop Rd/ Harlan Rd	4,525	46	7,422	2,897	1.6%
2	Lathrop Rd/ I-5 NB Ramps	4,488	206	8,900	4,412	4.7%
3	Lathrop Rd-Spartan Way/I-5 SB Ramps	3,620	364	9,790	6,170	5.9%
4	Spartan Way/Golden Valley Parkway	2,645	434	9,903	7,258	6.0%
Lathrop Rd/I-5 Interchange (Total)		15,278	1,050	36,015	20,737	5.1%
8	Manthey Rd/ Roth Rd	680	164	2,410	1,730	9.5%
9	Roth Rd/ I-5 SB Ramps	1,242	164	3,820	2,578	6.4%
10	Roth Rd/ I-5 NB Ramps	2,073	89	4,640	2,567	3.5%
11	Roth Rd/ Harlan Rd	2,487	16	5,150	2,663	0.6%
Roth Rd/I-5 Interchange (Total)		6,482	433	16,020	9,538	4.5%

7.2 INTERSECTION QUEUING – CUMULATIVE PLUS PROJECT CONDITIONS

Under this scenario, simulation showed queue spillback at six of the eight intersections studied, during one or both peak hours. Queue lengths exceeded the available storage at Lathrop Road/Harlan Road

(Intersection #1), Lathrop Road/I-5 Northbound Ramps (Intersection #2), Lathrop Road-Spartan Way/I-5 Southbound Ramps (Intersection #3), Spartan Way/Golden Valley Parkway (Intersection #4), Roth Road/I-5 Southbound Ramps (Intersection #9), and Roth Road/Harlan Road (Intersection #11). At Intersections #1, #4, and #9, this involved turning queues spilling back from the turn pockets into the turn lane taper and potentially adjacent through lane. At Intersections #2, #3 and #11, the queues would extend into the upstream intersection. The proposed project would generate one new queue spillback at Intersection #1, although this queue length can be fully accommodated within the taper without affecting the adjacent through lane. No queue spillbacks would affect the freeway mainline at either interchange.

It should be noted that both interchanges are planned for reconstruction before 2040, as discussed above, and as such these projected queuing conditions are unlikely to occur.

Table 24: Intersection Queuing – Cumulative plus Project Conditions

#	Intersection	Control	Direction	Movement	Existing Storage (ft.)	Peak Hour ¹	Cumulative Queue Length (ft.)	Cumulative plus Project Queue Length (ft.)

Notes:

* Indicates that available storage extends to upstream intersection or freeway mainline

** Excess queue can be accommodated in taper.

- Indicates no queue reported by SimTraffic. Zero volume assigned.

Bold indicates that required storage exceeds existing storage.

8.0 ADDITIONAL ANALYSES

The following sections provide additional analyses of other transportation issues associated with the project site, including:

- Vehicle Miles Traveled,
- Site Access,
- On-site Circulation,
- Truck Operations,
- Parking, and
- Pedestrian, Bicycle, and Transit Impacts

Unlike the LOS impact methodology, the analyses in these sections are generally based on professional judgment in accordance with the standards and methods employed by traffic engineers. However, Vehicle miles traveled (VMT) is evaluated as a CEQA impact. Although operational issues are not considered CEQA impacts, they do describe traffic conditions that are relevant to the project environment.

8.1 VEHICLE MILES TRAVELED (VMT)

As previously mentioned, the San Joaquin County Transportation Analysis Guidelines (September 2020) were used. On page 14, the guidelines recommend that the estimated VMT for a proposed project be obtained by inserting the proposed project into the San Joaquin COG 2018 RTP Model. Since the project is not screened out from the maps in the SJ County Transportation Analysis guidelines, a base year plus project model run was performed.

The Ashley Furniture project is located in TAZ #1744 of the SJCOG model. Currently, TAZ #1744 has five employees coded. The project will add a total of 1,295 employees. There are three types of employment in this project; warehouse, office, and retail. From the project’s Site Plan, there are 1,400,000 square feet of warehouse, 25,000 square feet of office, and 100,000 square feet of retail. The Southern California Council of Governments (SCAG) employment density study finds that there are a median of 1,225 square feet per employee for warehouses, 466 square feet per employee for offices, and 1,023 square feet per employee for regional retail. Thus, it is expected that 1,143 new employees will come from the warehouse, 98 employees from the office, and 54 employees for the retail portion. **Table 20** shows the land use changes for the base year with project model run.

Table 25: Land Use Changes for Base Year

<i>TAZ</i>	<i>Employees (Industrial Land Use)</i>	<i>Employees (Office Land Use)</i>	<i>Employees (Retail Land Use)</i>	<i>Total Employees</i>
1744	+1,143	+98	+54	+1,295

1,295 employees in the industrial land use category (which is what the SJCOG model uses for warehouses) was added in TAZ #1744 and the project year traffic model was rerun. The results are summarized in **Table 21**.

Table 26: VMT per Employee Comparison

TAZ	Base Year Average Daily VMT per Employee (per SJCOG Model)	Regional Average (per SJCOG Model)	15% Below Regional Average (per SJCOG Model)	Base Year Plus Project Average Daily VMT per Resident (per Model run)
1744	10.48	19.1	16.2	15.43

The base year average daily VMT per employee for TAZ #1744 is 10.48. Adding in the project’s 1,295 employees brought the daily VMT per employee to 15.43, an increase of 4.95. These numbers are reasonable since the project’s location is in relative close proximity to the residential districts of Lathrop, and also brings much needed jobs into an area that has very little employment.

The project’s 15.43 daily VMT per employee is lower than the San Joaquin County VMT threshold of 16.2. VMT impacts for the Ashley Furniture Homestore project are found to be **less-than-significant** for the base year, and thus no mitigation is required for VMT impacts attributable to this project.

8.2 SITE ACCESS

The project site plan dated March 29, 2023 is shown in **Figure 2**. The proposed Ashley Furniture includes various drive aisles that allow for circulation throughout the development. Drive aisles for the passenger vehicle parking spaces are approximately 26-36 feet wide. Drive aisles for heavy trucks (larger than SU-30) are 60-72 feet wide, according to the project site plan. The south driveway (Intersection #12) is a full access driveway, 40 feet wide, which accommodates two-way entry. The driveway for Intersection #14 is a full access driveway, approximately 40 feet wide. The driveway for Intersection #15 is also a full access driveway, however this driveway is dedicated for truck traffic only and would be approximately 70 feet wide. Heavy trucks will be restricted to only using this driveway on Manthey Road and would generally be restricted to using the I-5/Roth Road interchange.

The site plan includes the proposed lane geometry on Manthey Road and Dos Reis Road, including the installation of raised medians. Based on overall project design, driveway locations and access restrictions are appropriate. Any proposed landscaping should be maintained in order to maintain sight distance to and from the driveways. The proposed driveway locations, design, and sight distance are all **adequate**.

8.3 ON-SITE CIRCULATION

As shown in **Figure 2**, the project site plan includes multiple drive aisles. These drive aisles connect to individual parking areas located throughout the project site. Sight lines appear to be clear at internal intersections. Landscaping should be maintained periodically to provide adequate sight distance.

Drive aisles in the parking areas are typically 26-36 feet wide, with two-way travel and perpendicular parking throughout the site. Drive aisles can accommodate emergency vehicles throughout the site. Trash enclosures are located to the north and south of the site.

The site plan shows all proposed pedestrian facilities on the project frontage and connectivity from Manthey Road to the retail showroom entrance. The project site plan does show four crosswalks connecting the

passenger vehicle parking lot to the retail showroom. The site plan shows two bike rack locations, one on the south side of the building and one on the east side.

The internal circulation for the project is considered **adequate**.

8.4 TRUCK OPERATIONS

The proposed Ashley furniture is proposing to restrict heavy trucks (larger than SU-30) from using the Lathrop Road/I-5 interchange at all times to alleviate potential congestion at those intersections. Instead, trucks will be using the Roth Road/I-5 interchange and head south on Manthey Road to access the Ashley Furniture site via the northernmost driveway only. Only local delivery trucks would be permitted on Dos Reis Boulevard and Golden Valley Parkway. Based on the level of service analysis, additional truck traffic on the Roth Road intersections is not expected to degrade the LOS to unacceptable operations.

8.5 PARKING

According to the City of Lathrop Municipal code (Chapter 17.76 Off-Street Parking and Loading), the project is required to provide the following parking spaces:

- One space per 400 square feet of floor area for office uses.
- One space per 600 square feet of floor area for retail stores that primarily handle bulky merchandise such as furniture.
- One space per 2,000 square feet of floor area for warehouse uses.

Based on the City requirements, the project is required to provide 60 stalls for office uses, 184 stalls for retail uses, and 649 stalls for warehouse uses. This amounts to a total of 893 stalls of parking the project is required to provide. For parking lots providing 501-1000 parking spaces, the Americans with Disabilities Act (ADA) requires that at least two percent must be accessible. The project is proposing to provide a total of 942 stalls, including 20 total accessible spaces. A breakdown is as follows:

- 722 standard spaces (9'x20');
- 19 accessible spaces (9'x20');
- Six van accessible spaces (12'x20');
- 145 electric vehicle (EV) capable spaces (9'x20');
- 38 electric vehicle charging station (EVCS) standard spaces (9'x20');
- Two EVCS van accessible spaces (12'x20');
- Five EVCS standard accessible spaces (9'x20'); and
- Five EVCS ambulatory spaces (10'x20').

The project is also providing 1,104 trailer stalls (ranging from 12' x 30' to 12' x 53') for its own operations. The proposed project satisfies the City and ADA parking requirements.

8.6 PEDESTRIAN, BICYCLE, AND TRANSIT IMPACTS

Pedestrian Access

Pedestrian access to the project site is facilitated by new sidewalks along Dos Reis Road and Manthey Road, paved walkway within the parking lot and crosswalks. The proposed development project does not conflict

with existing and planned pedestrian facilities; therefore, the impact to pedestrian facilities is ***less than significant***.

Bicycle Access

As shown in **Figure 3**, there are no existing bicycle facilities on De Lima Road, Manthey Road and Dos Reis Road. If the project proposes bicycle facilities, it should show them on future site plans. The project does not conflict with existing and planned bicycle facilities; therefore, the impact to bicycle facilities is ***less than significant***.

Transit Access

The project site is within a 3/4 mile of two San Joaquin RTD bus stops, located on the northwest corner of Lathrop Road/Harlan Road and in front of the Save Mart. Due to the lack of development north of Spartan Way, there are sidewalk gaps from the proposed project site to the bus stops. As development in the area increases, sidewalks should be installed to close the gap in pedestrian facilities. Impacts to transit service are expected to be ***less than significant***.

Appendix A –Level of Service Methodology

TECHNICAL MEMORANDUM

Subject: Highway Capacity Manual – Level of Service Definitions

The purpose of this memorandum is to define level of service (LOS) and the procedures for its calculation.

LOS is commonly used as a measure of effectiveness (MOE) / quality of service (QOS) for traffic. The procedures for LOS determination and calculation are found within the Transportation Research Board’s (TRB) *Highway Capacity Manual* (HCM), 6th Edition. MOE / QOS generally consist of quantitative metrics to characterize operational conditions within a traffic stream. LOS is a measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience.

Six levels of service are defined for each facility type that has procedures available. Alphabetical letters designated each grade from A to F. LOS A represents the best operating conditions; LOS F represents the worst operating conditions. Each LOS represents a range of operating conditions and drivers’ perceptions of those conditions. Safety is not included in the measure to establish service level.

A general description of LOS for every types of roadway facilities is shown in **Table 1**.

Table 1: General LOS by Facility Type

	Uninterrupted Flow	Interrupted Flow
Facility Example Types		
	Freeways	Signalized intersections
	Multi-lane highways	Two-way stop controlled intersections
	Two-lane highways	All-way stop controlled intersections
	Urban Streets	Roundabouts
LOS Character		
A	Free flow.	Very low delay.
B	Stable flow. Presence of other users noticeable.	Low delay.
C	Stable flow. Comfort and convenience starts to decline.	Moderate delay
D	High density stable flow.	Acceptable delay
E	Unstable flow.	Limit of acceptable delay,
F	Forced or breakdown flow.	Unacceptable delay.

Signalized Intersections

Signalized intersection LOS is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection, and control delay experienced by each vehicle. LOS can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach; control delay and volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. Delay quantifies the increase in travel time due to traffic signal control; it is also a surrogate measure of driver discomfort and fuel consumption. The v/c ratio quantifies the degree to which a phase's capacity is utilized by a lane group. A v/c ratio of 1.0 or more indicates cycle capacity is fully utilized and represents failure from a capacity perspective (just as delay in excess of 80 sec/veh represents failure from a delay perspective). The detailed methodology for determining LOS at signalized intersection is presented in Chapter 19 of the HCM. The LOS for signalized intersections are defined in **Table 2**.

Table 2: Signalized LOS Summary

LOS	Definition	Control Delay Range (s/veh)	v/c Range
A	Very low control delay. This level is typically assigned when the v/c ratio is low and either progression is exceptionally favorable or the cycle length is short. Most vehicles arrive during the green phase. Many vehicles do not stop at all.	≤ 10	≤ 1.0
B	The v/c ratio is low. There is good progression, short cycle lengths, or both. More vehicles stop, causing higher levels of delay.	≤ 20	≤ 1.0
C	Higher delays occur in favorable progression or a due to a moderate cycle length, or both. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during a given cycle) may begin to appear. The number of vehicles stopping is still considered low-to-moderate, though many vehicles still pass through the intersection without stopping.	≤ 35	≤ 1.0
D	The influence of congestion becomes more apparent. Longer delays may result from some combination of a high v/c ratio, ineffective progression, long cycle length, or high volumes. Many vehicles stop, the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	≤ 55	≤ 1.0
E	Typically considered the limit of acceptable delay. High delays usually indicate a very high v/c ratio, poor progression, long cycle lengths, and high volumes. Most cycles fail to clear the queue.	≤ 80	≤ 1.0
F	Delays are unacceptable to most drivers. Conditions are considered oversaturated. Arrival flow rates exceed the capacity of the intersection (v/c in excess of 1.0). Many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to higher delay.	> 80	> 1.0

Two-Way Stop Controlled Intersections

At two-way stopped controlled (TWSC) intersections, LOS is not defined for the intersection as a whole or for major-street approaches for three primary reasons:

1. The major-street through and right-turning traffic are assumed to experience zero delay as traffic progression operates unimpeded;
2. The disproportionate number of major-street through traffic at a typical TWSC intersection skews the weighted average of all movements, resulting in very low overall average delay for all vehicles, and
3. The resulting low delay can mask LOS deficiencies for minor movements.

The LOS for the minor street and the mainline left-turn traffic are dependent on the volume and capacity of the available lanes, and the number and frequency of acceptable gaps in the major street traffic to make a conflicting turn. The LOS grade is provided for all conflicting movements at an intersection and is based on the total average control delay experienced by each vehicle and the lane group volume-to-capacity (v/c) ratios. The delay includes the time it takes a vehicle to move from the back of a queue through the intersection. The detailed methodology for determining LOS at TWSC intersection is presented in Chapter 20 of the HCM. The TWSC LOS descriptions are provided in **Table 3**.

Table 3: TWSC LOS Summary

LOS	Definition	Control Delay Range (s/veh)	v/c Range
A	Usually no conflicting traffic. Drivers can easily find gaps in traffic to maneuver. v/c is low.	≤ 10	≤ 1.0
B	Occasionally some delay due to conflicting traffic. Drivers can find gaps in traffic. v/c is low.	≤ 15	≤ 1.0
C	There is some noticeable delay due to conflicting traffic. Drivers are still able to find gaps in traffic.	≤ 25	≤ 1.0
D	Drivers experience delay due to less gaps in traffic to maneuver. Lane group v/c creeps closer to 1.0.	≤ 35	≤ 1.0
E	Delay approaches driver tolerance levels. Drivers will occasionally find gaps in traffic to maneuver. Lane group v/c approaches 1.0.	≤ 50	≤ 1.0
F	Delay exceed driver tolerance levels or v/c exceeds 1.0 or both.	> 50	> 1.0

All-Way Stop Controlled and Roundabout Intersections

All-way stopped controlled (AWSC) intersections and roundabout intersections are based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection, and control delay. LOS can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay alone is used to characterize LOS for the entire intersection or an approach; control delay and volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. The delay includes the time it takes a vehicle to move from the back of a queue through the intersection. A v/c ratio of 1.0 represents failure from a capacity perspective (just as delay in excess of 80 sec/veh represents failure from a delay perspective).

The detailed methodology for determining LOS at AWSC and roundabout intersection are presented in Chapter 21 and Chapter 22 respectively in the HCM. The AWSC and roundabout LOS descriptions are shared and are provided in **Table 4**.

Table 4: AWSC and Roundabout LOS Summary

LOS	Definition	Control Delay Range (s/veh)	v/c Range
A	Usually no conflicting traffic. Drivers can easily find gaps in traffic to maneuver. v/c is low.	≤ 10	≤ 1.0
B	Occasionally some delay due to conflicting traffic. Drivers can find gaps in traffic. v/c is low.	≤ 15	≤ 1.0
C	There is some noticeable delay due to conflicting traffic. Drivers are still able to find gaps in traffic.	≤ 25	≤ 1.0
D	Drivers experience delay due to less gaps in traffic to maneuver. Lane group v/c creeps closer to 1.0.	≤ 35	≤ 1.0
E	Delay approaches driver tolerance levels. Drivers will occasionally find gaps in traffic to maneuver. Lane group v/c approaches 1.0.	≤ 50	≤ 1.0
F	Delay exceed driver tolerance levels or v/c exceeds 1.0 or both.	> 50	> 1.0

Right-Side Lateral Clearance Adj. (fRLC)	0.0	Density (D), pc/mi/ln	26.0
Total Ramp Density Adjustment	4.5	Level of Service (LOS)	C
Adjusted Free-Flow Speed (FFSadj), mi/h	70.9		

HCS7 Basic Freeway Report

Project Information

Analyst	TJKM	Date	11/18/2021
Agency	City of Lathrop	Analysis Year	2022
Jurisdiction	Caltrans	Time Period Analyzed	PM Peak - Background plus Project
Project Description	Interstate 5 SB south of Roth Rd		

Geometric Data

Number of Lanes, In	3	Terrain Type	Level
Segment Length (L), ft	-	Percent Grade, %	-
Measured or Base Free-Flow Speed	Base	Grade Length, mi	-
Base Free-Flow Speed (BFFS), mi/h	75.4	Total Ramp Density (TRD), ramps/mi	1.48
Lane Width, ft	12	Free-Flow Speed (FFS), mi/h	70.9
Right-Side Lateral Clearance, ft	10		

Adjustment Factors

Driver Population	All Familiar	Final Speed Adjustment Factor (SAF)	1.000
Weather Type	Non-Severe Weather	Final Capacity Adjustment Factor (CAF)	1.000
Incident Type	No Incident	Demand Adjustment Factor (DAF)	1.000

Demand and Capacity

Demand Volume veh/h	4242	Heavy Vehicle Adjustment Factor (fhv)	0.898
Peak Hour Factor	0.94	Flow Rate (Vp), pc/h/ln	1675
Total Trucks, %	11.40	Capacity (c), pc/h/ln	2400
Single-Unit Trucks (SUT), %	-	Adjusted Capacity (cadj), pc/h/ln	2400
Tractor-Trailers (TT), %	-	Volume-to-Capacity Ratio (v/c)	0.70
Passenger Car Equivalent (Et)	2.000		

Speed and Density

Lane Width Adjustment (fLW)	0.0	Average Speed (S), mi/h	67.9
Right-Side Lateral Clearance Adj. (fRLC)	0.0	Density (D), pc/mi/ln	24.7
Total Ramp Density Adjustment	4.5	Level of Service (LOS)	C
Adjusted Free-Flow Speed (FFSadj), mi/h	70.9

Lathrop Ashley Warehouse Detailed Report

Table of Contents

1. Basic Project Information
 - 1.1. Basic Project Information
 - 1.2. Land Use Types
 - 1.3. User-Selected Emission Reduction Measures by Emissions Sector
2. Emissions Summary
 - 2.1. Construction Emissions Compared Against Thresholds
 - 2.2. Construction Emissions by Year, Unmitigated
 - 2.4. Operations Emissions Compared Against Thresholds
 - 2.5. Operations Emissions by Sector, Unmitigated
3. Construction Emissions Details
 - 3.1. Site Preparation (2023) - Unmitigated
 - 3.3. Site Preparation (2024) - Unmitigated
 - 3.5. Grading (2024) - Unmitigated
 - 3.7. Building Construction (2024) - Unmitigated

3.9. Building Construction (2025) - Unmitigated

3.11. Paving (2025) - Unmitigated

3.13. Architectural Coating (2025) - Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.2. Unmitigated

4.4. Water Emissions by Land Use

4.4.2. Unmitigated

4.5. Waste Emissions by Land Use

4.5.2. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Lathrop Ashley Warehouse
Construction Start Date	10/1/2023
Operational Year	2025
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.40
Precipitation (days)	9.00
Location	37.83215690690747, -121.29196103002339
County	San Joaquin
City	Lathrop
Air District	San Joaquin Valley APCD
Air Basin	San Joaquin Valley
TAZ	2103
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.14

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
------------------	------	------	-------------	-----------------------	------------------------	--------------------------------	------------	-------------

Unrefrigerated Warehouse-No Rail	1,487	1000sqft	89.5	14,866	0.00	0.00	—	—
----------------------------------	-------	----------	------	--------	------	------	---	---

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	18.9	annual days of extreme heat
Extreme Precipitation	2.40	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	13.4	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	0	0	0	N/A
Drought	0	0	0	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	1	1	1	2
Drought	1	1	1	2
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
-----------	---------------------------------

Exposure Indicators	—
AQ-Ozone	57.1
AQ-PM	53.2
AQ-DPM	53.5
Drinking Water	98.2
Lead Risk Housing	13.6
Pesticides	84.4
Toxic Releases	47.3
Traffic	56.4
Effect Indicators	—
CleanUp Sites	90.1
Groundwater	99.7
Haz Waste Facilities/Generators	92.3
Impaired Water Bodies	87.0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	86.0
Healthy Places Index Score for Project Location (b)	42.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Warehouse is 1,486,607 square feet.
Construction: Construction Phases	Revised construction schedule based on Project size and an anticipated buildout date of approximately 2025.
